

SAS[®] Certification Review: Base Programming for SAS[®]9

Course Notes

SAS® Certification Review: Base Programming for SAS®9 Course Notes was developed by Michele Ensor. Additional contributions were made by Kent Reeve, Lori Rothenberg, Lorilyn Russell, Larry Stewart, and Su Chee Tay. Editing and production support was provided by the Curriculum Development and Support Department.

Table of Contents

Course Description	vi
Prerequisites	vii
Chapter 1 Introduction	1-1
1.1 Specifics about the SAS Base Programming Exam	1-3
1.2 Specifics about This Review Course	1-10
1.3 SAS Fundamental Concepts	1-15
1.4 Answers to Questions	1-32
Chapter 2 Working with SAS Data Sets	2-1
2.1 Reading and Creating Data Sets	2-3
2.2 Selecting Observations.....	2-29
2.3 Sorting Observations with the SORT Procedure.....	2-42
2.4 Combining Data Sets	2-46
2.5 Answers to Questions	2-61
Chapter 3 Working with Raw Data and Microsoft Excel Files.....	3-1
3.1 Reading Raw Data Files: Part 1	3-3
3.2 Reading Raw Data Files: Part 2	3-17
3.3 Controlling When a Record Loads.....	3-32
3.4 Reading Microsoft Excel Files.....	3-39
3.5 Answers to Questions	3-42
Chapter 4 Creating Variables	4-1
4.1 Creating Variables with the Assignment Statement	4-3

4.2	Creating Variables Conditionally	4-9
4.3	Creating Accumulator Variables	4-20
4.4	Answers to Questions	4-27
Chapter 5 Manipulating Data.....		5-1
5.1	Using Functions to Manipulate Data	5-3
5.2	Converting Character and Numeric Data.....	5-34
5.3	Processing Data with DO Loops.....	5-41
5.4	Processing Data with Arrays.....	5-52
5.5	Answers to Questions	5-59
Chapter 6 Generating Reports		6-1
6.1	Creating Detail Reports with the PRINT Procedure	6-3
6.2	Creating Formats with the FORMAT Procedure	6-22
6.3	Creating Frequency Tables with the FREQ Procedure	6-29
6.4	Creating Summary Reports with the MEANS Procedure.....	6-34
6.5	Directing Reports to External Files with ODS.....	6-39
6.6	Answers to Questions	6-45
Chapter 7 Additional Information		7-1
7.1	More Specifics about the SAS Base Programming Exam	7-3
7.2	Additional Preparation Resources.....	7-7
7.3	Test-Taking Strategies.....	7-12

Course Description

This course provides a review of the majority of topics in the SAS® Base Programming Exam for SAS®9. It addresses the five exam content areas: Accessing Data, Creating Data Structures, Managing Data, Generating Reports, and Handling Errors.

To learn more...

For information on other courses in the curriculum, contact the SAS Education Division at 1-800-333-7660, or send e-mail to training@sas.com. You can also find this information on the Web at support.sas.com/training/ as well as in the Training Course Catalog.

For a list of other SAS books that relate to the topics covered in this Course Notes, USA customers can contact our SAS Publishing Department at 1-800-727-3228 or send e-mail to sasbook@sas.com. Customers outside the USA, please contact your local SAS office.

Also, see the Publications Catalog on the Web at support.sas.com/pubs for a complete list of books and a convenient order form.

Prerequisites

Before attending this course, you should

- be an experienced programmer with knowledge of the five exam content areas
- have taken SAS® Programming 1: Essentials and SAS® Programming 2: Data Manipulation Techniques or have equivalent experience.

Chapter 1 Introduction

1.1	Specifics about the SAS Base Programming Exam.....	1-3
1.2	Specifics about This Review Course.....	1-10
1.3	SAS Fundamental Concepts.....	1-15
1.4	Answers to Questions.....	1-32

1.1 Specifics about the SAS Base Programming Exam

SAS Credentials and Exams

SAS offers professional certifications that validate a candidate's knowledge within two areas:

6

Programming Certification

SAS offers two credentials in the programming area:

**SAS Certified Base
Programmer
Credential for SAS®9**

- SAS Base Programming Exam for SAS®9

**SAS Certified
Advanced
Programmer
Credential for SAS®9**

- SAS Base Programming Exam for SAS®9
- SAS Advanced Programming Exam for SAS®9

7

SAS Base Programming Exam for SAS®9

The intended candidate for the SAS Base Programming Exam is someone with current SAS programming **experience** in the following five content areas:

1. Accessing Data
2. Creating Data Structures
3. Managing Data
4. Generating Reports
5. Handling Errors

In addition, the candidate must be familiar with the enhancements and new functionality available in SAS®9.

8

1. Accessing Data

- Use FORMATTED and LIST input to read raw data files.
- Use INFILE statement options to control processing when you read raw data files.
- Use various components of an INPUT statement to process raw data files, including column and line pointer controls and trailing @ controls.
- Combine SAS data sets.
- Access Excel workbooks.

10

2. Creating Data Structures

- Create temporary and permanent SAS data sets.
- Create and manipulate SAS date values.
- Export data to standard and comma-delimited raw data files.
- Control which observations and variables in a SAS data set are processed and output.

11

3. Managing Data

- Investigate SAS libraries using utility procedures.
- Sort observations in a SAS data set.
- Use assignment statements in the DATA step.
- Modify variable attributes using options and statements in the DATA step.
- Accumulate subtotals and totals using DATA step statements.
- Use SAS functions to manipulate character data, numeric data, and SAS date values.
- Use SAS functions to convert character data to numeric and vice versa.
- Process data using DO loops and SAS arrays.
- Validate and clean data.

12

4. Generating Reports

- Use the PRINT procedure to generate list reports.
- Use Base SAS procedures to generate summary reports and frequency tables.
- Enhance reports through the use of labels, SAS formats, user-defined formats, titles, footnotes, and SAS reporting options.
- Use ODS statements to direct reports to external files.

13

5. Handling Errors

- Identify and resolve programming logic errors.
- Recognize and correct syntax errors.
- Examine and resolve data errors.

14

Exam Details

- Exam administered by Prometric
- A \$180 exam fee (United States and Canada)
- Exam taken on a computer
- Seventy multiple-choice questions
- Closed book
- Two hours to complete the test
- Passing score of 65% (46+ correct answers)
- Score received after completing the exam

16

Prometric

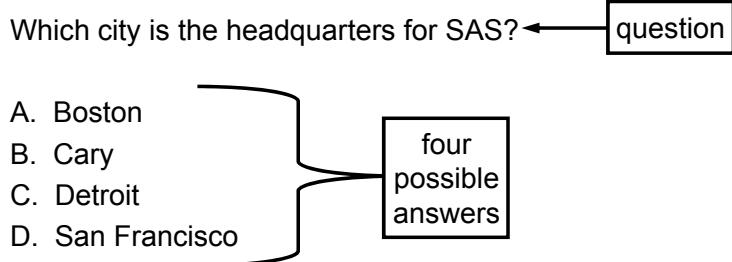

www.prometric.com/sas

17

Multiple-Choice Questions

All multiple-choice questions contain a question and four possible answers.

For example:

Which city is the headquarters for SAS?  question

- A. Boston
- B. Cary
- C. Detroit
- D. San Francisco

four possible answers

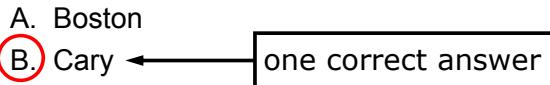

18

Multiple-Choice Questions

There is only one correct answer.

For example:

Which city is the headquarters for SAS?

- A. Boston
- B. Cary**  one correct answer
- C. Detroit
- D. San Francisco

19

Multiple-Choice Questions

Given the following data set:

STATE	CITY
MA	Boston
NC	Cary
MI	Detroit
CA	San Francisco

Support information
might appear prior
to the question.

What is the value of **CITY** for the second observation?

- A. Boston
- B. Cary** ← one correct answer
- C. Detroit
- D. San Francisco

20

SAS Certification Web Site

The screenshot shows the SAS Certification Web Site at support.sas.com/certify. The page title is "SAS Global Certification Program". On the left, there's a sidebar with links for Learning Center, Bookstore, Training, Certification (which is highlighted), and more. The main content area features a large image of two people, a man and a woman, with the text "The global standard for SAS software expertise for 10 years running!". To the right, there's a quote from a hiring manager about the importance of SAS certification. Below the quote, it says "Sunil Gupta, Associate Director, Statistical Programming, Quintiles". On the right side, there are sections for "HOT TOPICS" (Exam Registration, Packages and Discounts, Recertification, Directory of SAS Certified Professionals) and "STAY IN TOUCH" (Subscribe to e-newsletter, Contact us). A "Get Recertified!" button is at the bottom right.

<http://support.sas.com/certify>

21

1.2 Specifics about This Review Course

SAS Certification Review: Base Programming for SAS®9

This course is a review of the majority of the topics in the SAS Base Programming Exam for SAS®9.

The five content areas of the exam are presented in six chapters.

Accessing Data
Creating Data Structures
Managing Data
Generating Reports
Handling Errors

Chapter	Section
1	SAS Fundamental Concepts
2	Working with SAS Data Sets
3	Working with Raw Data and Excel Files
4	Creating Variables
5	Manipulating Data
6	Generating Reports

23

SAS Certification Review: Base Programming for SAS®9

This course is a review of the majority of the topics in the SAS Base Programming Exam for SAS®9.

re-view

- 1: to view or see again
- 2: to examine or study again

This course assumes prior knowledge of the topics.

24

SAS Certification Review: Base Programming for SAS®9

This course is a review of ~~the majority of~~ the topics in the SAS Base Programming Exam for SAS®9.

ma·jor·i·ty

1 : a number or percentage equaling more than half of a total

The certification exam can include topics beyond those topics discussed in this course.

25

SAS Certification Review: Base Programming for SAS®9

This review course will

- refresh your mind on some details you might have forgotten
- include topics with which you might have limited experience
- familiarize you with SAS terminology
- determine in what areas you need to do additional studying
- help you determine if you are ready to take the exam
- provide practice for answering SAS questions.

26

Questions in This Course

Different question format types are used throughout the lecture portion of this course.

- multiple-choice with one correct answer (A-D)
- multiple-choice with more than one correct answer (1-6)
- yes or no
- discussion
- polls

Remember: The certification exam uses only the multiple choice format with one correct answer.

27

Questions in This Course

All questions in this course are identified with a  in the top-right corner of the slide.

Selecting Observations

The following program is submitted:

```
data work.portion;
  set sashelp.retail(firstobs=5 obs=10);
run;
```

How many observations are in the output data set?

- A. 5
- B. 6
- C. 10
- D. 14

28

69

Questions in This Course

All question slides are followed by an answer slide, which is identified with an **A** in the top right corner of the slide.

Selecting Observations

The following program is submitted:

```
data work.portion;
  set sashelp.retail(firstobs=5 obs=10);
run;
```

How many observations are in the output data set?

- A. 5
- B. 6
- C. 10
- D. 14

Answer slides are not in your course notes. A summary of correct answers is located in the last section of each chapter.

29

70

Questions in This Course

What format type is this question?

- A. multiple-choice with one correct answer (A-D)
- B. multiple-choice with more than one correct answer (1-6)
- C. yes or no
- D. polls

30

Exercises in This Course (Appendix A)

Different exercise format types are used throughout this course.

- True or False
- Answer the Questions
- Match the Values
- Fill in the Blanks
- Fill in the Table
- Complete the Program
- Add a Statement
- Find the Mistakes

Some exercises are completed before a topic is reviewed, while other exercises are completed after a topic is reviewed.

Remember: The certification exam uses only the multiple choice format with one correct answer.

32

Practice Exam in This Course (Appendix B)

The practice exam contains 50 questions in six sections.

Chapter	Section	Questions	Time Limit
1	SAS Fundamental Concepts	5	9 minutes
2	Working with SAS Data Sets	9	15 minutes
3	Working with Raw Data and Excel Files	9	15 minutes
4	Creating Variables	9	15 minutes
5	Manipulating Data	9	15 minutes
6	Generating Reports	9	15 minutes

Remember: The certification exam is a computer-based exam with 70 questions and a two-hour time limit.

33

1.3 SAS Fundamental Concepts

Refer to Exercise 1 for Chapter 1 in Appendix A.

SAS Steps

The DATA step and the PROC (procedure) step are the two types of steps in a SAS program.

```

data work.enroll;
  infile 'enrollment.dat';
  input @1 first_name $8. @9 last $9.
    @20 state2 $2. @23 age_ 2.
    @26 enrolldate date9.;
run;

libname project 'C:\workshop\winsas\lwcrb';

proc sort data=work.enroll
  out=project.enroll;
  by last;
run;

proc print data=project.enroll;
  var last state2 age_ enrolldate;
  format enrolldate mmddyy10. ;
run;
  
```

39

DATA Step

PROC Step

PROC Step

DATA Step

In general, the DATA step manipulates data.

- The input for a DATA step can be of several types, such as raw data or a SAS data set.
- The output from a DATA step can be of several types, such as a SAS data set or a report.

input
raw data

```

data work.enroll; ←
  infile 'enrollment.dat';
  input @1 first_name $8. @9 last $9.
    @20 state2 $2. @23 age_ 2.
    @26 enrolldate date9. ;
run;
  
```

output
data set

40

Q

DATA Step

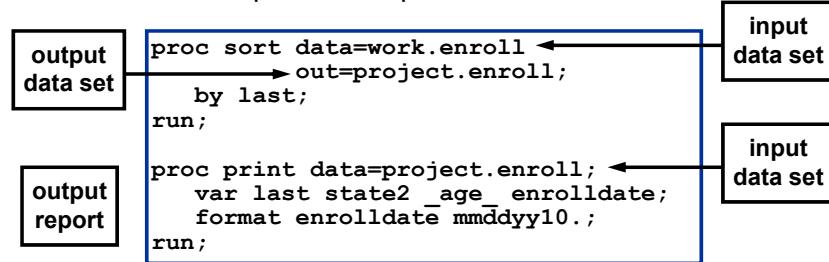

Yes or No: Do all SAS programs contain a DATA step?

41

PROC Step

In general, the PROC step analyzes data, produces output, or manages SAS files.

- The input for a PROC step is usually a SAS data set.
- The output from a PROC step can be of several types, such as a report or an updated SAS data set.

43

SAS Statements

A SAS statement is a series of items that might include keywords, SAS names, special characters, and operators.

The two types of SAS statements are as follows:

- those that are used in DATA and PROC steps
- those that are global in scope and can be used anywhere in a SAS program

All SAS statements end with a semicolon.

44

SAS Statements

How many statements are in the PROC SORT step?

```
proc sort data=work.enroll
          out=project.enroll;
  by last;
run;

proc print data=project.enroll;
  var last state2 _age_ enrolldate;
  format enrolldate mmddyy10. ;
run;
```

45

Global Statements

Global statements

- are used anywhere in a SAS program
- stay in effect until changed or canceled, or until you end your SAS session.

```
libname project 'C:\workshop\winsas\lwcrb';
proc sort data=work.enroll
           out=project.enroll;
  by last;
run;
```

global statement

47

Global Statements

What are some additional examples of global statements?

1. DATA
2. TITLE
3. LABEL
4. FORMAT
5. OPTIONS
6. FOOTNOTE

48

SAS Data Sets

A SAS data set has these characteristics:

- is a SAS file stored in a SAS library that SAS creates and processes
- contains data values that are organized as a table of observations (rows) and variables (columns)
- contains descriptor information such as the data types and lengths of the variables

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

50

SAS Libraries

A SAS library is a collection of one or more SAS files, including SAS data sets, that are referenced and stored as a unit.

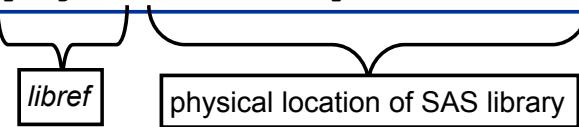

- In a directory-based operating environment, a SAS library is a group of SAS files that are stored in the same directory.
- In z/OS (OS/390), a SAS library is a group of SAS files that are stored in an operating environment file.

51

SAS Libraries

A logical name (*libref*) can be assigned to a SAS library using the LIBNAME statement.

```
libname project 'C:\workshop\winsas\lwcrb';
```

The *libref*

- can be up to 8 characters long
- must begin with a letter (A-Z) or an underscore (_)
- can only contain letters, digits (0-9), or underscores.

52

SAS Libraries

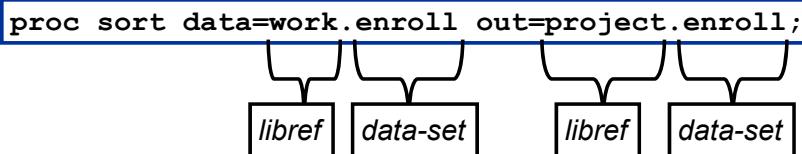

Which of the following sentences is **true** concerning the LIBNAME statement?

- A. The LIBNAME statement must go in a DATA step.
- B. The LIBNAME statement must end in a semicolon.
- C. The LIBNAME statement must be the first statement in a program.
- D. The LIBNAME statement must be followed by the RUN statement.

53

Two-Level SAS Data Set Names

A SAS data set can be referenced using a two-level SAS data set name.

- *libref* is the logical name that is associated with the physical location of the SAS library.
- *data-set* is the data set name, which can be up to 32 characters long, must begin with a letter or an underscore, and can contain letters, digits, and underscores.

55

One-Level SAS Data Set Names

A data set referenced with a one-level name is automatically assigned to the **Work** library by default.

For example, the following two statements are equivalent:

```
proc sort data=work.enroll out=project.enroll;
```

```
proc sort data=enroll out=project.enroll;
```

56

Temporary and Permanent SAS Data Sets

How many of the following data sets are permanent data sets?

`work.enroll`

`temp.enroll`

`project.enroll`

`enroll`

57

Temporary and Permanent SAS Data Sets

A **temporary** SAS data set is one that exists only for the current SAS session or job.

- The **Work** library is a temporary data library.
- Data sets held in the **Work** library are deleted at the end of the SAS session.

A **permanent** SAS data set is one that resides on the external storage medium of your computer and is not deleted when the SAS session terminates.

- Any data library referenced with a LIBNAME statement is considered a permanent data library by default.

59

Variables

Data values are organized into columns called *variables*.

Variables have attributes, such as name and type, that enable you to identify them and that define how they can be used.

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14283

60

Variable Names

By default, a SAS variable name

- can be up to 32 characters long
- must begin with a letter (A-Z) or an underscore (_)
- can only contain letters, digits (0-9), or underscores.

first_name	last	state2	age	enrolldate
------------	------	--------	-----	------------

61

Q

Variable Names

Which of the following variable names is valid?

- A. street#
- B. zip_code
- C. 2address
- D. last name

62

Variable Types

The two types of SAS variables are listed below:

- character
- numeric

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

three character variables

two numeric variables

64

Variable Types: Character

Character variables are stored with a length of 1 to 32,767 bytes with 1 character equaling 1 byte.

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

8 bytes 9 bytes 2 bytes

Character variables can contain letters (A-Z), numeric digits (0-9), and other special characters (_ , #, %, &,...).

65

Variable Types: Numeric

Numeric variables are stored as floating-point numbers with a default byte size of 8.

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

8 bytes 8 bytes

To be stored as a floating point number, the numeric value can contain numeric digits (0-9), plus or minus sign, decimal point, and E for scientific notation.

66

Q

Variable Types

How should a date be stored in SAS?

- A. character
- B. numeric

67

SAS Dates

A SAS date value is a value that represents the number of days between January 1, 1960, and a specified date.

- Dates before January 1, 1960, are negative numbers.
- Dates after January 1, 1960, are positive numbers.

To reference a SAS date value in a SAS program, use a SAS date constant.

- A SAS date constant is a date (DDMMYY YYYY) in quotation marks followed by the letter D.
- Example:

'12NOV1986'd

69

SAS Dates

What is the numeric SAS date value for December 25, 1959?

- A. -6
- B. -7
- C. 6
- D. 8

70

Missing Data

Missing data is a value that indicates that no data value is stored for the variable in the current observation.

- A missing numeric value is displayed as a single period (.).
- A missing character value is displayed as a blank space.

VIEWTABLE: Project.Enroll					
	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO		15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

72

The CONTENTS Procedure

The CONTENTS procedure shows the descriptor portion of a SAS data set.

```
proc contents data=project.enroll;
run;
```

Partial Output

Alphabetic List of Variables and Attributes

#	Variable	Type	Len
4	_age_	Num	8
5	enrolldate	Num	8
1	first_name	Char	8
2	last	Char	9
3	state2	Char	2

73

The CONTENTS Procedure

Which step displays the directory of the **Project** library and suppresses printing the contents of individual data sets?

- A.

```
proc contents data=project;
run;
```
- B.

```
proc contents data=project.all;
run;
```
- C.

```
proc contents data=project nocontents;
run;
```
- D.

```
proc contents data=project._all_ nods;
run;
```

74

The PRINT Procedure

The PRINT procedure can show the data portion of a SAS data set.

```
proc print data=project.enroll;
run;
```

Obs	first_name	last	state2	_age_	enrolldate
1	Danny	Brown	CO	.	15684
2	William	Johnson		22	17318
3	Samantha	McCormick	CA	47	16674
4	Tina	Stewart	TX	53	14287

76

The CONTENTS and PRINT Procedures

Which program has the correct syntax for the CONTENTS and PRINT procedures?

- A.

```
proc contents project.enroll;
run;
proc print project.enroll;
run;
```
- B.

```
proc contents data=project.enroll
run;
proc print data=project.enroll
run;
```
- C.

```
proc contents data=project.enroll;
run;
proc print data=project.enroll;
run;
```

77

Comments

There are two ways to add comments in a SAS program.

```
*The SORT procedure is creating a data set;
proc sort data=work.enroll
           out=project.enroll;
   by last;
run;

/* The PRINT procedure is creating a report. */

proc print data=project.enroll;
  var last state2 _age_ enrolldate;
  format enrolldate mmddyy10.;
run;
```

During processing, SAS ignores text in comments.

79

SAS Log

The SAS log is a record of your submitted SAS program.

```
125 libname project 'C:\workshop\winsas\lwcrb\data';
NOTE: Libref PROJECT was successfully assigned as follows:
      Engine:      V9
      Physical Name: C:\workshop\winsas\lwcrb\data

126 proc sort data=work.enroll
127           out=project.enroll;
128   by last;
129 run;

NOTE: There were 4 observations read from the data set WORK.ENROLL.
NOTE: The data set PROJECT.ENROLL has 4 observations and 5 variables.
```

- Original program statements are identified by line numbers.
- SAS messages can include the words NOTE, INFO, WARNING, or ERROR.

80

SAS Log

What are the issues with the following program based on the SAS log?

```
154 proc content data=project.enroll;
ERROR: Procedure CONTENT not found.
155 run;

NOTE: The SAS System stopped processing this step because of errors.

156 proc print project.enroll;
           22          200
ERROR 22-322: Syntax error, expecting one of the following: ;, DATA,
DOUBLE, HEADING, LABEL, N, NOOBS, OBS, ROUND, ROWS,
SPLIT, STYLE, UNIFORM, WIDTH.
ERROR 200-322: The symbol is not recognized and will be ignored.
157 run;

NOTE: The SAS System stopped processing this step because of errors.
```

2.1	Reading and Creating Data Sets	2-3
2.2	Selecting Observations.....	2-29
2.3	Sorting Observations with the SORT Procedure.....	2-42
2.4	Combining Data Sets.....	2-46
2.5	Answers to Questions.....	2-61

2.1 Reading and Creating Data Sets

Reading and Creating Data Sets

```
data work.newprice;  
  set golf.supplies;  
  <additional programming statements>  
run;
```

1. What is the name of the data set being read?
2. What is the name of the data set being created?

3

DATA Statement

The DATA statement begins a DATA step and provides names for any output SAS data sets that are created.

```
data work.newprice; Output Data Set  
  set golf.supplies;  
  <additional programming statements>  
run;
```

- The DATA statement can create temporary or permanent data sets.

5

SET Statement

The SET statement reads an observation from one or more SAS data sets for further processing in the DATA step.

```
data work.newprice;
  set golf.supplies; Input Data Set
  <additional programming statements>
run;
```

- By default, the SET statement reads all variables and all observations from the input data sets.
- The SET statement can read temporary or permanent data sets.

6

Additional Programming Statements

Additional programming statements can be added to perform further processing in the DATA step.

For example, an assignment statement can be added to create a new variable based on an expression. Chapter 4

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

creates the variable
saleprice based
on the price
variable from the
golf.supplies
data set

7

Additional Programming Statements

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

Input Data Set

	mfg	type	price
1	Crew	Distance	8.1
2	Crew	Spin	8.25
3	Crew	Titanium	9.5
4	Hifly	X12000	13.75
5	Hifly	X22000	14.8
6	White	Strata	10.8
7	White	Aero	12.3
8	White	XL	14.5
9	White	Flite	16.2

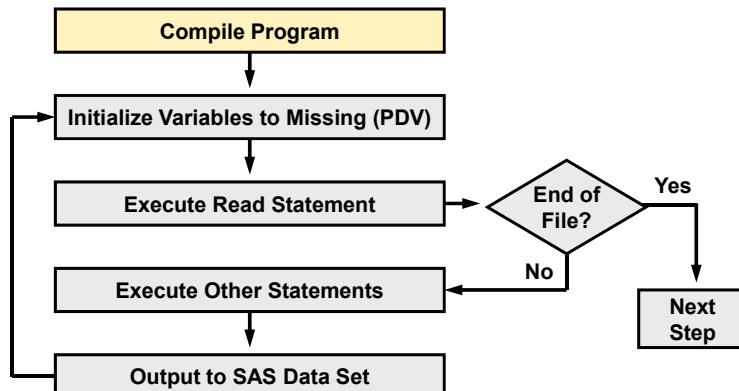

How many variables are in the output data set **work.newprice**?

- A. 3
- B. 4
- C. 5
- D. 6

8

DATA Step Execution

When a DATA step is submitted, it is first **compiled** and then **executed**.

10

Compilation Phase

During the compilation phase, SAS does the following:

- checks the syntax of the SAS statements
- translates the statements into machine code
- identifies the name, type, and length of each variable

The following three items are potentially created:

- input buffer
- program data vector (PDV)
- descriptor information

11

Input Buffer

The *input buffer* is a logical area in memory into which SAS reads each record of a raw data file when SAS executes an INPUT statement.

- This buffer is created only when the DATA step reads raw data.
- When the DATA step reads a SAS data set, SAS reads the data directly into the program data vector.

12

Program Data Vector (PDV)

The *program data vector* is a logical area in memory where SAS builds a data set, one observation at a time.

Along with data set variables and computed variables, the PDV contains the following two automatic variables:

- the `_N_` variable, which counts the number of times the DATA step begins to iterate
 - the `_ERROR_` variable, which signals the occurrence of an error caused by the data during execution
- The value of `_ERROR_` is either 0 (indicating no errors exist), or 1 (indicating that one or more errors occurred).

13

Program Data Vector (PDV)

Q

Which of the following statements is **false** concerning the `_N_` and `_ERROR_` variables?

- A. SAS does not write the `_N_` and `_ERROR_` variables to the output data set.
- B. SAS increments the `_N_` variable by 1 for each iteration of the DATA step.
- C. SAS automatically generates the `_N_` and `_ERROR_` variables for every DATA step.
- D. SAS sets the `_ERROR_` variable equal to the total number of errors caused by the data during execution.

14

Program Data Vector (PDV)

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

VIEWTABLE: Golf.Supplies

	mfg	type	price

variables from **golf.supplies**
data set

variable from
assignment
statement

automatic
variables

16

Program Data Vector (PDV)

Q

Which of the following is **not** one of the items in the PDV at compile time?

A. byte size of the variable
 B. initial value of the variable
 C. name of the variable
 D. type (character or numeric) of the variable

17

Descriptor Information

The *descriptor portion* is information that SAS creates and maintains about each SAS data set, including data set attributes and variable attributes.

Examples of descriptor information include the following:

- the name of the data set
- the date and time that the data set was created
- the names, data types (character or numeric), and lengths of the variables

19

Descriptor Information

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

Partial Descriptor Information (Variable Attributes):

#	Variable	Type	Len
1	mfg	Char	6
3	price	Num	8
4	saleprice	Num	8
2	type	Char	8

20

Execution Phase

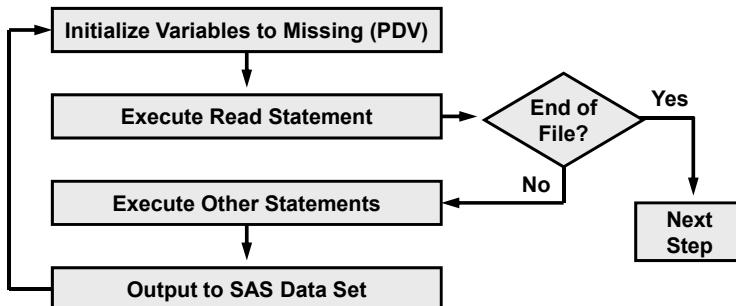

During the execution phase, SAS does the following:

- initializes the PDV to missing and sets the initial values of `_N_` and `_ERROR_`
- reads data values into the PDV
- executes any subsequent programming statements
- outputs the observation to a SAS data set
- returns to the top of the DATA step
- resets the PDV to missing for any variables not read directly from a data set and increments `_N_` by 1
- repeats the process until the end-of-file is detected

This is the default flow of the DATA step execution phase. Options and the placement of statements can alter this flow.

21

Execution Phase

This is the default flow of the DATA step execution phase. Options and the placement of statements can alter this flow.

22

Execution Phase

- initializes the PDV to missing and sets the initial values of `_N_` and `_ERROR_`

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

How many times does SAS iterate through the DATA step?

- A. 0
- B. 1
- C. 9
- D. 10

34

Execution Phase

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

Next steps:

- Eliminate variables.
- Add dollar signs.
- Add column headings.
- Use the debugger.

VIEWTABLE: Golf.Supplies			Input Data Set		VIEWTABLE: Work.Newprice			Output Data Set		
	mfg	type	price			mfg	type	price	saleprice

36

DROP and KEEP Statements

- The DROP statement specifies the names of the variables to omit from the output data set.
- The KEEP statement specifies the names of the variables to write to the output data set.

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
  drop mfg price; 
run;
```

Placement of statement is irrelevant; statement is applied at output time.

VIEWTABLE: Work.Newprice				Output Data Set	
	mfg	type	price		saleprice
1	Low	Distance	8.1		6.075
2	Cre	Spin	8.25		6.1875

8	White	XL	14.5
9	White	Elite	16.2

Which KEEP statement is equivalent to the DROP statement in the above program?

- A. `keep type;`
- B. `keep type saleprice;`

38

FORMAT and LABEL Statements

Chapter 6

- The FORMAT statement associates formats to variable values.
- The LABEL statement assigns descriptive labels to variable names.

```
data work.newprice;
  set golf.supplies;
  saleprice = price * 0.75;
  drop mfg price;
  format saleprice dollar18.2;
  label type='Type of Ball'
    saleprice='Sale Price';
run;
```

40

FORMAT and LABEL Statements

Chapter 6

```
proc contents data=work.newprice;
run;
```

Alphabetic List of Variables and Attributes

#	Variable	Type	Len	Format	Label
2	saleprice	Num	8	DOLLAR18.2	Sale Price
1	type	Char	8		Type of Ball

- FORMAT and LABEL statements assigned in a DATA step are considered **permanent** attributes (stored in the descriptor portion).

41

FORMAT and LABEL Statements

Chapter 6

```
proc print data=work.newprice label;
run;
```

Obs	Type of Ball	Sale Price
1	Distance	\$6.08
2	Spin	\$6.19
3	Titanium	\$7.13
4	X12000	\$10.31
5	X22000	\$10.95
6	Strata	\$7.95

8	XL	\$10.88
9	Flite	\$12.15

42

DATA Step Debugger

How is the DATA step debugger invoked?

- A. adding a / DEBUG option to the DATA statement
- B. adding a DEBUG statement after the DATA statement
- C. adding the DEBUG option to the OPTIONS statement
- D. adding the DEBUG=YES option to the OPTIONS statement

43

DATA Step Debugger

The DATA step debugger consists of windows and a group of commands that provide an interactive way to identify logic and data errors in DATA steps.

DEBUGGER LOG

```

Stepped to line 10 column 4
> e_all_
mfg = Crew
type = Distance
price = 8.1
saleprice =
ERROR_ = 0
_N_ = 1
>
Stepped to line 15 column 1
>
Stepped to line 9 column 4
>

```

Debugger Commands:

- STEP
- EXAMINE
- WATCH
- QUIT

DEBUGGER SOURCE

```

8 data work.newprice / debug;
9 set golf.supplies;
10 saleprice = price * 0.75;
11 drop mfg price;
12 format saleprice dollar18.2;
13 label type='Type of Ball';
14 label saleprice='Sale Price';
15 run;

```

45

Refer to Exercise 1 for Chapter 2 in Appendix A.

Implicit Output

By default, at the end of each iteration, every DATA step contains an implicit OUTPUT statement that tells SAS to write observations to the data set or data sets that are being created.

```
data work.total;
  set work.scores;
  total=test1+test2;
run;
```

implicit output

VIEWTABLE: Work.Scores			
	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

Input Data Set

VIEWTABLE: Work.Total			
	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

Output Data Set

48

Implicit Output

Q

Yes or No: Will the following two programs produce the same results?

```
data work.total;
  set work.scores;
  total=test1+test2;
run;
```

```
data work.total;
  set work.scores;
  total=test1+test2;
  output;
run;
```

49

OUTPUT Statement

The OUTPUT statement without arguments causes the current observation to be written to all data sets that are named in the DATA statement.

```
data work.total;
  set work.scores;
  total=test1+test2;
  →output;
run;
```

51

OUTPUT Statement

Multiple OUTPUT statements can be used in a DATA step.

```
data work.rotate;
  set work.scores;
  test=test1;
  →output;
  test=test2;
  →output;
  drop test1 test2;
run;
```

VIEWTABLE: Work.Scores

	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

VIEWTABLE: Work.Rotate

	name	test
1	Kent	73
2	Kent	79

4	Mary	94
5	Sally	75
6	Sally	86
7	Thomas	92
8	Thomas	95

52

OUTPUT Statement

```
data work.rotate;
  set work.scores;
  test=test1;
  →output;
  test=test2;
  drop test1 test2;
run;
```

VIEWTABLE: Work.Scores Input Data Set

	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

How many observations are in the final data set, **work.rotate**?

- A. 0
- B. 2
- C. 4
- D. 8

53

OUTPUT Statement

Placing an explicit OUTPUT statement in a DATA step overrides the implicit output, and SAS adds an observation to a data set only when an explicit OUTPUT statement is executed.

```
data work.rotate;
  set work.scores;
  test=test1;
  →output;
  test=test2;
  drop test1 test2;
run;
```

no implicit output

VIEWTABLE: Work.Scores Input Data Set

	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

VIEWTABLE: Work.Rotate Output Data Set

	name	test
1	Kent	73
2	Mary	89
3	Sally	75
4	Thomas	92

55

Creating Multiple Data Sets

- The DATA statement can specify multiple output data sets.
- The OUTPUT statement can specify the data set names.

```
data work.first
      work.second;
  set work.scores;
  test=test1;
  → output work.first;
  test=test2;
  → output work.second;
  drop test1 test2;
run;
```

56

Creating Multiple Data Sets

```
data work.first
      work.second;
  set work.scores;
  test=test1;
  → output work.first;
  test=test2;
  → output work.second;
  drop test1 test2;
run;
```

VIEWTABLE: Work.Scores				Input Data Set
	name	test1	test2	
1	Kent	73	79	
2	Mary	89	94	
3	Sally	75	86	
4	Thomas	92	95	

VIEWTABLE: Work.First		Output Data Set
	name	test
1	Kent	73
2	Mary	89
3	Sally	75
4	Thomas	92

VIEWTABLE: Work.Second		Output Data Set
	name	test
1	Kent	79
2	Mary	94
3	Sally	86
4	Thomas	95

57

Creating Multiple Data Sets

```
data work.total work.first work.second;
  set work.scores;
  total=test1+test2;
  output;
run;
```

Which data set(s) does the OUTPUT statement populate?

- A. `work.total`
- B. `work.first`
- C. `work.second`
- D. `work.total, work.first, and work.second`

58

Creating Multiple Data Sets

Using the OUTPUT statement without arguments causes the current observation to be written to all data sets that are named in the DATA statement.

```
data work.total
  work.first
  work.second;
  set work.scores;
  total=test1+test2;
  output;
  drop test1 test2;
run;
```

VIEWTABLE: Work.Total		Output Data Set
	name	total
1	Kent	152
2	Mary	183
3	Sally	161
4	Thomas	187

VIEWTABLE: Work.First		Output Data Set
	name	total
1	Kent	152
2	Mary	183
3	Sally	161
4	Thomas	187

VIEWTABLE: Work.Second		Output Data Set
	name	total
1	Kent	152
2	Mary	183
3	Sally	161
4	Thomas	187

60

Creating Multiple Data Sets

```

data work.total
  work.first
  work.second;
  set work.scores;
  total=test1+test2;
  →output work.total;
  test=test1;
  →output work.first;
  test=test2;
  →output work.second;
  drop test1 test2;
run;

```

The DROP and KEEP statements apply to all output data sets.

VIEWTABLE: Work.Total		
	name	total
1	Kent	152
2	Mary	183
3	Sally	161
4	Thomas	187

Output Data Set

VIEWTABLE: Work.First

3	Sally	161
4	Thomas	187

Output Data Set

61

DROP= and KEEP= Options

- The DROP= data set option excludes the variables for writing to a specific output data set.
- The KEEP= data set option specifies the variables for writing to a specific output data set.

```

data work.total (keep=name total test1 test2)
  work.first (drop=test1 test2)
  work.second (keep=name total test);
  set work.scores;
  total=test1+test2;
  output work.total;
  test=test1;
  output work.first;
  test=test2;
  output work.second;
run;

```

62

DROP= and KEEP= Options

```
data work.total (keep=name total test1 test2)
  work.first (drop=test1 test2)
  work.second (keep=name total test);
  set work.scores;
  total=test1+test2;
  output work.total;
  test=test1;
  output work.first;
  test=test2;
  output work.second;
run;
```

VIEWTABLE: Work.First		
	name	total
1	Kent	152
2	Mary	183
3	Sally	161
4	Thomas	187

VIEWTABLE: Work.Total			
	name	test1	test2
1	Kent	73	79
2	Mary	89	94
3	Sally	75	86
4	Thomas	92	95

VIEWTABLE: Work.Second		
	name	test
1	Kent	79
2	Mary	94
3	Sally	86
4	Thomas	95

63

Other Statements Using the OUTPUT Statement

The OUTPUT statement can stand alone or be part of an IF-THEN or SELECT/WHEN statement or be in DO loop processing. [Chapters 4 and 5](#)

Example with the IF-THEN statement:

```
data female
  male
  all(keep=name weight height);
  set sashelp.class;
  if sex='F' then output female all;
  else if sex='M' then output male all;
run;
```

- Multiple data sets can be specified in the OUTPUT statement.

64

Q

Other Statements Using the OUTPUT Statement

```
data female
      male
      all(keep=name weight height);
      set sashelp.class;
      if sex='F' then output female all;
      else if sex='M' then output male all;
run;
```

sashelp.class
contains five variables.

How many variables are in the output data set **Female**?

- A. 2
- B. 3
- C. 5
- D. 6

65

Refer to Exercise 2 for Chapter 2 in Appendix A.

2.2 Selecting Observations

Selecting Observations

By default, all observations of the input data set are written to the output data set.

```
data work.all;  
  set sashelp.retail;  
run;
```

Input data set
sashelp.retail
has 58 observations.

Output data set
work.all
has 58 observations.

70

Selecting Observations

The FIRSTOBS= and OBS= data set options can be used to control which observations are read from the input data set.

```
data work.ten;  
  set sashelp.retail(obs=10);  
run;
```

Input data set
sashelp.retail
has 58 observations.

Output data set
work.ten
has 10 observations.

FIRSTOBS= and OBS= are valid for input processing only. That is, they are not valid for output processing.

71

Q

Selecting Observations

The following program is submitted:

```
data work.portion;
  set sashelp.retail(firstobs=5 obs=10);
run;
```

How many observations are in the output data set?

- A. 5
- B. 6
- C. 10
- D. 14

72

FIRSTOBS= and OBS= Options

- The FIRSTOBS= data set option specifies a starting point for processing an input data set.
- The OBS= data set option specifies an ending point for processing an input data set.

```
data work.portion;
  set sashelp.retail(firstobs=5 obs=10);
run;
```

Input data set
sashelp.retail
has 58 observations.

Output data set
work.portion
has 6 observations (obs
5,6,7,8,9, & 10).

- ☞ The OBS= option specifies the number of the last observation, and not how many observations there are to process.

74

FIRSTOBS= and OBS= Options

Which step has invalid syntax?

- A.

```
data shoes(firstobs=101 obs=200);
  set sashelp.shoes;
run;
```
- B.

```
data shoes;
  set sashelp.shoes
    (firstobs=101 obs=200);
run;
```
- C.

```
proc print data=sashelp.shoes
  (firstobs=101 obs=200);
run;
```

75

Selecting Observations Based on an Expression

The following statements can be used to select observations based on an expression:

- WHERE statement
- Subsetting IF statement
- IF-THEN DELETE statement

All three of the statements reference an **expression**.

77

Expression

An *expression* is a sequence of operands and operators that forms a set of instructions that define a condition for selecting observations.

- *Operands* are the following:
 - constants (character or numeric)
 - variables (character or numeric)
 - SAS functions
- *Operators* are symbols that request a comparison, logical operation, or arithmetic calculation.

78

Operands

- A *constant* is a fixed value such as a number, quoted character string, or date constant.
 - If the value is numeric, do not use quotation marks.
 - If the value is character, use quotation marks.
 - A SAS date constant is a date (DDMMYY) in quotation marks followed by the letter D.
- A *variable* is a variable coming from a data set, a variable created in an assignment statement, or an automatic variable created by the DATA step.
- A SAS *function* is a routine that performs a computation or system manipulation on arguments and returns a value. Chapter 5

79

Comparison Operators

Comparison operators compare a variable with a value or with another variable.

Operators		Definition
EQ	=	equal to
NE	\neq $\sim=$ $\neg=$	not equal to
GT	>	greater than
GE	\geq	greater than or equal to
LT	<	less than
LE	\leq	less than or equal to
IN		equal to one of a list

80

Operands and Comparison Operators

Which of the following is **not** a valid expression?

- A. `qtr1 <= qtr2`
- B. `address = ' '`
- C. `sales gt 6400`
- D. `name ne Mary Ann`

81

Logical Operators

Logical operators combine or modify expressions.

Operators		Definition
AND	&	logical and
OR		logical or
NOT	^	logical not

83

Arithmetic Operators

Arithmetic operators indicate that an arithmetic calculation is performed.

Operators		Definition
**		exponentiation
*		multiplication
/		division
+		addition
-		subtraction

If a missing value is an operand for an arithmetic operator, the result is a missing value.

84

Logical and Arithmetic Operators

Which of the following is **not** a valid expression?

- A. `x * 5 / A - C eq Y ** 2`
- B. `level = 'up' | type = 'low'`
- C. `january + february le 90000`
- D. `salary > 50000 title not = 'Manager'`

85

Special WHERE Operators

The WHERE statement can use special WHERE operators.

Operators		Definition
BETWEEN – AND		an inclusive range
CONTAINS	?	a character string
LIKE		a character pattern
SOUNDS LIKE	=*	spelling variation
IS NULL		missing value
IS MISSING		missing value

87

Q

Special WHERE Operators

```
name like 'M__k%'
```

two underscores

Which names will be selected based on the above expression?

1. Mark
2. Marcia
3. Mickey
4. Matthew
5. Michael

88

Expression Examples

```
sales > 100000
sales eq .
name = 'Smith'
name = ' '
sales gt 100000 and name = 'Smith'
sales gt 100000 or name = 'Smith'
revenue >= 150 and revenue <= 999
revenue between 150 and 999
revenue not between 150 and 999
month contains 'uary'
birthdate > '11JUL1968'd
upcase(state) = 'TX'
```

90

Selecting Observations Based on an Expression

Q

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

Which statement must be added to the above program to create an output data set with observations having **saleprice** greater than \$10?

- A. **if not (saleprice>10) then delete;**
- B. **if saleprice>10;**
- C. Either statement will work.

91

Selecting Observations Based on an Expression

Q

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
run;
```

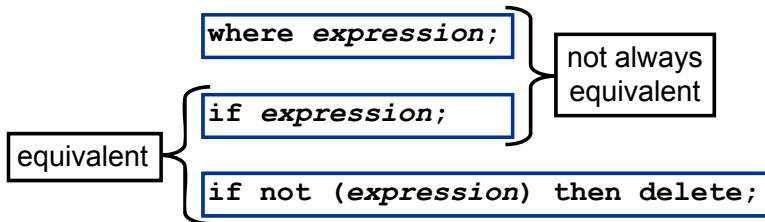

Which statement must be added to the above program to create an output data set with observations having **saleprice** greater than \$10?

- A. **where saleprice>10;**
- B. **if saleprice>10;**
- C. Either statement will work.

93

Selecting Observations Based on an Expression

There are three ways to select an observation based on an expression:

95

WHERE Statement

The WHERE statement causes the DATA step to process only those observations from a data set that meet the condition of the expression.

```

data work.newprice;
  set golf.supplies;
  where mfg='White';
  saleprice=price*0.75;
  if saleprice > 10;
run;
  
```

Placement of statement is irrelevant; statement is applied at input time.

The expression in the WHERE statement

- can reference variables that are from the input data set
- cannot reference variables created from an assignment statement or automatic variables (_N_ or _ERROR_).

96

WHERE Statement

```
data subset;
  set sales;
  difference=actual-predict;
  <insert statement here>
run;
```

Variables in Input Data Set			
#	Variable	Type	Len
1	DATE	Num	8
2	STATE	Char	8
3	PRODUCT	Char	10
4	ACTUAL	Num	8
5	PREDICT	Num	8

Which WHERE statement will create an **error** when submitted, if inserted in the above program?

- A. `where actual > predict;`
- B. `where difference ge 1000;`
- C. `where product in ('CHAIR','SOFA');`
- D. `where state='Texas' and date<'01JAN1998'd;`

97

Subsetting IF Statement

The subsetting IF statement causes the DATA step to continue processing only those observations in the program data vector that meet the condition of the expression.

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
  → if saleprice > 10;
run;
```

99

Subsetting IF Statement

- If the expression is **true** for the observation, SAS continues to execute the remaining statements in the DATA step, including the implicit OUTPUT statement at the end of the DATA step. The resulting SAS data set(s) contains a subset of the original SAS data set.
- If the expression is **false**, no further statements are processed for that observation, the current observation is not written to the data set, the remaining program statements in the DATA step are not executed, and SAS immediately returns to the beginning of the DATA step.

100

Q

Subsetting IF Statement

Which program will create an **ERROR** when submitted?

Variables in Input Data Set			
#	Variable	Type	Len
1	DATE	Num	8
2	STATE	Char	8
3	PRODUCT	Char	10
4	ACTUAL	Num	8
5	PREDICT	Num	8

- A.

```
data subset;
  set sales;
  if difference < 500;
  difference=actual-predict;
  if state='Texas';
run;
```
- B.

```
data subset;
  set sales;
  difference=actual-predict;
  if difference between 500 and 1000;
run;
```
- C.

```
data subset;
  set sales;
  difference=actual-predict;
  if product='CHAIR' and difference ge 100;
run;
```

101

WHERE Statement versus Subsetting IF Statement

- The WHERE statement selects observations before they are brought into the program data vector.
- The subsetting IF statement selects observations that were read into the program data vector.

```
data work.newprice;
  set golf.supplies;
  where mfg='White';
  saleprice=price*0.75;
  if saleprice > 10;
run;
```

103

IF-THEN DELETE Statement

The IF-THEN DELETE statement causes the DATA step to stop processing those observations in the program data vector that meet the condition of the expression.

```
data work.newprice;
  set golf.supplies;
  saleprice=price*0.75;
  if saleprice <= 10 then delete;
run;
```

If the expression is **true** for the observation, the current observation is not written to a data set, and SAS returns immediately to the beginning of the DATA step for the next iteration.

104

Refer to Exercise 3 for Chapter 2 in Appendix A.

2.3 Sorting Observations with the SORT Procedure

The SORT Procedure

The SORT procedure does the following:

- orders SAS data set observations by the values of one or more character or numeric variables
- either replaces the original data set or creates a new data set
- produces only an output data set, but no report
- arranges the data set by the values in ascending order by default

```
proc sort data=sashelp.shoes
          out=shoes;
  by descending region product;
run;
```

108

Refer to Exercise 4 for Chapter 2 in Appendix A.

PROC SORT Statement

Examples:

```
proc sort data=sashelp.shoes;
proc sort data=sashelp.shoes
          out=shoes;
proc sort data=sashelp.shoes
          out=sasuser.sort;
```

- The DATA= option identifies the input SAS data set.
- The OUT= option names the output data set.
- Without the OUT= option, the SORT procedure overwrites the original data set.

111

BY Statement

The BY statement specifies the sorting variables.

Examples:

`by region;`

Ascending is the default order.

`by region product;`

`by region subsidiary product;`

- PROC SORT first arranges the data set by the values of the first BY variable.
- PROC SORT then arranges any observations that have the same value of the first BY variable by the values of the second BY variable.
- This sorting continues for every specified BY variable.

112

BY Statement

By default, the SORT procedure orders the values by ascending order.

The DESCENDING option reverses the sort order for the variable that immediately follows in the statement.

Examples:

`by region descending product;`

`by descending region product;`

`by descending region descending product;`

113

Q

BY Statement

Yes or No: Will the following program run successfully?

```
proc sort data=sashelp.shoes
          out=shoes;
  by descending region ascending product;
run;
```

114

BY Statement

In addition to the SORT procedure, a BY statement can be used in the DATA step and other PROC steps.

The data sets used in the DATA step and other PROC steps must be sorted by the values of the variables that are listed in the BY statement or have an appropriate index.

```
proc sort data=personnel;
  by descending empid lastname;
run;
proc print data=personnel;
  by descending empid;
run;
```

```
proc sort data=one;
  by id;
run;
proc sort data=two;
  by id;
run;
data both;
  merge one two;
  by id;
run;
```

116

BY Statement

What are the two problems associated with the following program?

```
proc sort data=sashelp.shoes
           out=shoes;
   by descending region product;
run;

data new;
   set sashelp.shoes;
   by region product;
run;
```

2.4 Combining Data Sets

Appending

The APPEND procedure adds the observations from one SAS data set to the end of another SAS data set.

```
proc append base=work.ytd data=work.may;
run;
```

- The BASE= option names the data set to which observations are added.
- The DATA= option names the data set containing observations that are added to the base data set.

121

Appending

Which statement is **false** concerning the APPEND procedure?

- A. The observations in the base data set are not read.
- B. Only two data sets can be used at a time in one step.
- C. The variable information in the descriptor portion of the base data set can change.
- D. When the DATA= data set contains variables that are not in the BASE= data set, the FORCE option is needed.

122

Appending

```
70 proc append base=work.ytd data=work.apr;
71 run;

NOTE: Appending WORK.APR to WORK.YTD.
WARNING: Variable country was not found on DATA file.
NOTE: There were 1 observations read from the data set WORK.APR.
NOTE: 1 observations added.
NOTE: The data set WORK.YTD has 4 observations and 3 variables.
```

BASE= (before append)

VIEWTABLE: Work.Ytd

	month	country	Target
1	JAN	US	2000000
2	FEB	US	2100000
3	MAR	US	2500000

VIEWTABLE: Work.Apr DATA=

BASE= (after append)

VIEWTABLE: Work.Ytd

	month	country	Target
1	JAN	US	2000000
2	FEB	US	2100000
3	MAR	US	2500000
4	APR		3600000

124

Appending

```
75 proc append base=work.ytd data=work.may;
76 run;

NOTE: Appending WORK.MAY to WORK.YTD.
WARNING: Variable Sales was not found on BASE file. The variable will
not be added to the BASE file.
WARNING: Variable country was not found on DATA file.
ERROR: No appending done because of anomalies listed above. Use FORCE
option to append these files.
NOTE: 0 observations added.
NOTE: The data set WORK.YTD has 4 observations and 3 variables.
NOTE: The SAS System stopped processing this step because of errors.
```

BASE= (before append)

VIEWTABLE: Work.Ytd

	month	country	Target
1	JAN	US	2000000
2	FEB	US	2100000
3	MAR	US	2500000
4	APR		3600000

VIEWTABLE: Work.May DATA=

VIEWTABLE: Work.Ytd

	month	Target	Sales
1	MAY	3500000	3650000

125

Appending

```

77 proc append base=work.ytd data=work.may force;
78 run;

NOTE: Appending WORK.MAY to WORK.YTD.
WARNING: Variable Sales was not found on BASE file. The variable will
not be added to the BASE file.
WARNING: Variable country was not found on DATA file.
NOTE: FORCE is specified, so dropping/truncating will occur.
NOTE: There were 1 observations read from the data set WORK.MAY.
NOTE: 1 observations added.

```

VIEWTABLE: Work.Ytd

BASE=
(after append)

	month	country	Target
1	JAN	US	2000000
2	FEB	US	2100000
3	MAR	US	2500000
4	APR		3600000
5	MAY		3500000

126

Appending

Which statement is **true** concerning the FORCE option?

- The FORCE option is needed when the BASE= data set contains variables that are not in the DATA= data set.
- The FORCE option is needed when the DATA= data set contains variables that are not in the BASE= data set.

127

Concatenating

If more than one data set name appears in the SET statement, the resulting output data set is a concatenation of all the data sets that are listed.

```
data work.thirdqtr;
  → set work.oct
    work.nov
    work.dec;
run;
```

SAS reads all observations from the first data set, then all from the second data set, and so on, until all observations from all the data sets are read.

129

Concatenating

How many observations and variables are in the output data set **work.thirdqtr**?

```
data work.thirdqtr;
  → set work.oct
    work.nov
    work.dec;
run;
```

VIEWTABLE: Work.Oct Input Data Set

	region	date	sales
1	East	17075	1600000
2	West	17075	2100000

VIEWTABLE: Work.Nov Input Data Set

	region	date	sales
1	East	17106	2500000
2	West	17106	2600000

VIEWTABLE: Work.Dec Input Data Set

	region	date	sales
1	East	17136	3100000
2	West	17136	3000000

130

Concatenating

How many observations and variables are in the output data set `work.thirdqtr1`?

```
data work.thirdqtr1;
  → set work.oct1
    work.nov1
    work.dec1;
run;
```

VIEWTABLE: Work.Oct1

	region	sales
1	East	1600000
2	West	2100000

VIEWTABLE: Work.Nov1

	region	sales
1	East	2500000
2	West	2600000

VIEWTABLE: Work.Dec1

	area	sales
1	East	3100000
2	West	3000000

132

Concatenating

At compile time, SAS puts the variable information from the first data set into the PDV, then puts the variable information from the second into the PDV, and so on.

```
data company;
  → set divisionA divisionB;
run;
```

divisionA

#	Variable	Type	Len
1	name	Char	10
2	state	Char	2

divisionB

#	Variable	Type	Len
1	name	Char	15
2	location	Char	2

name	state	location	_ERROR_	N
\$ 10	\$ 2	\$ 2	N 8	N 8

134

Concatenating

```
data company;
  → set divisionA divisionB;
run;
```

VIEWTABLE: Work.Company			
	name	state	location
1	Joy	SC	
2	Tony	NC	
3	Michael	GA	
4	Margaret	FL	
5	Kelly		CA
6	Roger		NV
7	Mary Marga		TX

Output Data Set

#	Variable	Type	Len
1	name	Char	10
2	state	Char	2
3	location	Char	2

Next steps:

- Control byte size of **name**.
- Combine **state** and **location**.

135

LENGTH Statement

The LENGTH statement specifies the number of bytes for storing variables.

```
data company;
  → length name $ 15;
    set divisionA divisionB;
run;
```

VIEWTABLE: Work.Company			
	name	state	location
1	Joy	SC	
2	Tony	NC	
3	Michael	GA	
4	Margaret	FL	
5	Kelly		CA
6	Roger		NV
7	Mary Margaret		TX

Output Data Set

#	Variable	Type	Len
1	name	Char	15
2	state	Char	2
3	location	Char	2

136

Q

LENGTH Statement

Yes or No: Will you get the same results if the LENGTH statement is after the SET statement?

```
data company;
  set divisionA divisionB;
  → length name $ 15;
run;
```

137

RENAME= Option

The RENAME= data set option changes the names of variables.

```
data company;
  length name $ 15;
  → set divisionA(rename=(state=location))
    divisionB;
run;
```

- The RENAME= option specifies the variable that you want to rename equal to the new name of the variable.
- The list of variables to rename must be enclosed in parentheses.

139

RENAME= Option

Which of the following statements has proper syntax for the RENAME= option?

- A. `set divisionA(rename=name=first,
state=location)
divisionB(rename=name=first);`
- B. `set divisionA(rename=(name=first
state=location))
divisionB(rename=(name=first));`
- C. `set divisionA(rename=(name=first)
(state=location))
divisionB(rename=(name=first));`
- D. `set divisionA(rename=(name=first),
(state=location))
divisionB(rename=(name=first));`

140

Interleaving

Use a single SET statement with multiple data sets and a BY statement to interleave the specified data sets.

```
data company;  
  length name $ 15;  
  set divisionA(rename=(state=location))  
    divisionB;  
  → by name;  
  run;
```

The observations in the new data set are arranged by the values of the BY variable or variables, and within each BY group, by the order of the data sets in which they occur.

142

Interleaving

The data sets that are listed in the SET statement must be sorted by the values of the variables that are listed in the BY statement, or they must have an appropriate index.

```

737  data company;
738    length name $ 15;
739    set divisionA(rename=(state=location))
740      divisionB;
741    by name;
742  run;

ERROR: BY variables are not properly sorted on data
      set WORK.DIVISIONB.
name=Roger location=NV FIRST.name=1 LAST.name=1
_ERROR_=1 _N_=3
NOTE: The SAS System stopped processing this step
      because of errors.

```

143

Interleaving

```

proc sort data=divisionA;
  by name;
run;
proc sort data=divisionB;
  by name;
run;
data company;
  length name $ 15;
  set divisionA(rename=(state=location))
    divisionB;
  by name;
run;

```

144

VIEWTABLE: Work.Company		
	name	location
1	Joy	SC
2	Kelly	CA
3	Margaret	FL
4	Mary Margaret	TX
5	Michael	GA
6	Roger	NV
7	Tony	NC

divisionA

divisionB

Interleaving

Q

```
proc sort data=divisionA;
  by descending state;
proc sort data=divisionB;
  by descending location;
data company;
  length name $ 15;
  set divisionA(rename=(state=location))
    divisionB;
  by location;
run;
```

What is the result of this program?

- A. An **error** because BY variables are not properly sorted.
- B. An **error** because the variable **location** is not found in **work.divisionA**.
- C. The data set **work.company** is created with seven observations and two variables.

145

Merging

- The MERGE statement joins observations from two or more SAS data sets into single observations.
- The BY statement specifies the common variables to match-merge observations.

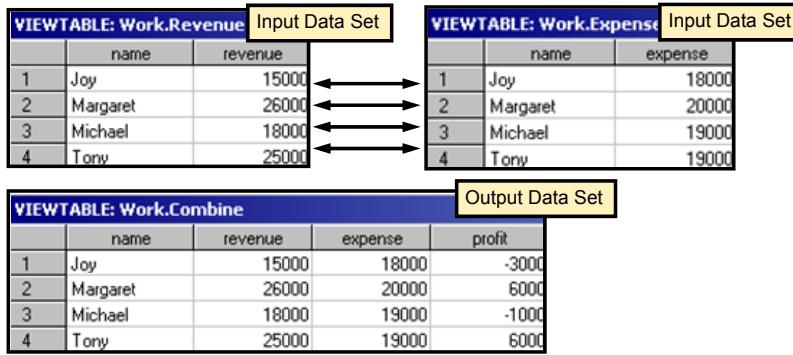

```
data combine;
  merge revenue expense;
  by name;
  profit=revenue-expense;
run;
```

- The variables in the BY statement must be common to all data sets.
- The data sets listed in the MERGE statement must be sorted in the order of the values of the variables that are listed in the BY statement, or they must have an appropriate index.

147

One-to-One Match-Merging

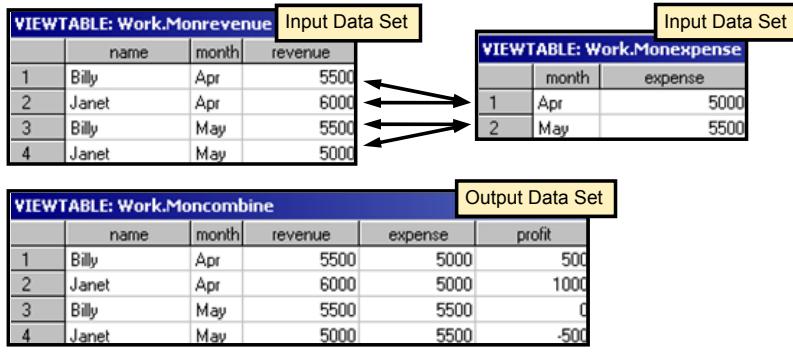

```
data combine;
  merge revenue expense;
  by name;
  profit=revenue-expense;
run;
```

148

Many-to-One Match-Merging

```
data moncombine;
  merge monrevenue monexpense;
  by month;
  profit=revenue-expense;
run;
```

149

Nonmatches

```
data combine1;
  merge revenue1 expense1;
  by name;
  profit=revenue-expense;
run;
```

How many observations are in the output data set **work.combine1**?

VIEWTABLE: Work.Revenue1			Input Data Set	
	name	revenue		
1	Caroline	25000		
2	Jack	18000		
3	Jenna	26000		
4	Thomas	15000		

VIEWTABLE: Work.Expense1			Input Data Set	
	name	expense		
1	Caroline	19000		
2	Jenna	20000		
3	Susan	19000		
4	Thomas	18000		

150

IN= Option

The IN= option creates a variable that indicates whether the data set contributed data to the current observation.

```
data combine1;
  merge revenue1 (in=rev)
                expense1 (in=exp);
  by name;
  profit=revenue-expense;
run;
```

Within the DATA step, the value of the variable is 1 if the data set contributed to the current observation, and 0 if the data set did not contribute to the current observation.

152

Q

IN= Option

Which of the following statements is **false** concerning the IN= option?

- A. The IN= variables are included in the SAS data set that is being created.
- B. The values of the IN= variables are available to program statements during the DATA step.
- C. When a data set contributes an observation for the current BY group, the IN= value is a numeric 1.
- D. The IN= data set option is specified in parentheses after a SAS data set name in the SET and MERGE statements.

153

IN= Option

```
data combine1;
  merge revenue1 (in=rev)
    expense1 (in=exp);
  by name;
  profit=revenue-expense;
run;
```

name \$ 10	revenue N 8	expense N 8	profit N 8	rev N 8	exp N 8	_ERROR_ N 8	N N8
Caroline	25000	19000	6000	1	1	0	1

Jenna	26000	20000	6000	1	1	0	3
Susan	.	19000	.	0	1	0	4
Thomas	15000	18000	-3000	1	1	0	5

155

IN= Option

Possible Scenarios	
<code>if rev=1 and exp=1;</code>	Matches only
<code>if rev and exp;</code>	
<code>if rev=1 and exp=0;</code>	Nonmatches from REVENUE1
<code>if rev and not exp;</code>	
<code>if rev=0 and exp=1;</code>	Nonmatches from EXPENSES1
<code>if not rev and exp;</code>	
<code>if rev=1;</code>	All observations from REVENUE1 (Matches and Nonmatches)
<code>if rev;</code>	
<code>if exp=1;</code>	All observations from EXPENSES1 (Matches and Nonmatches)
<code>if exp;</code>	
<code>if rev=0 or exp=0;</code>	Nonmatches from REVENUE1
<code>if not rev or not exp;</code>	and EXPENSES1

156

IN= Option

Q

```
data combine1;
  merge revenue1(in=rev)
    expense1(in=exp);
  by name;
  profit=revenue-expense;
run;
```

Which statement will give all observations from the **revenue1** data set regardless of matches or nonmatches?

- A. `if rev=1;`
- B. `if rev=1 and exp=1;`
- C. `if rev=1 and (exp=1 and exp=0);`
- D. `if (rev=1 and exp=1) and (rev=1 and exp=0);`

157

IN= Option

```
data revexp revonly exponly;
  merge revenuel (in=rev)
    expensel (in=exp);
  by name;
  if rev=1 and exp=1 then output revexp;
  else if rev=1 and exp=0 then output revonly;
  else if rev=0 and exp=1 then output exponly;
run;
```

VIEWTABLE: Work.Revenuel		Input Data Set		VIEWTABLE: Work.Revonly		Output Data Set	
	name	revenue			name	revenue	expense

Chapter 3 Working with Raw Data and Microsoft Excel Files

3.1	Reading Raw Data Files: Part 1	3-3
3.2	Reading Raw Data Files: Part 2	3-17
3.3	Controlling When a Record Loads.....	3-32
3.4	Reading Microsoft Excel Files.....	3-39
3.5	Answers to Questions.....	3-42

3.1 Reading Raw Data Files: Part 1

Reading Raw Data Files

```
data work.kids;
  infile 'kids.dat';
  input name $ 1-8 siblings 10
        @12 bdate mmddyy10.
        @23 allowance comma2.
        hobby1 $ hobby2 $ hobby3 $;
run;
```

1. What is the name of the raw data file being read?
2. What is the name of the data set being created?

4

DATA Statement

The DATA statement begins a DATA step and provides names for any output SAS data sets that are created.

```
data work.kids; Output Data Set
  infile 'kids.dat';
  input name $ 1-8 siblings 10
        @12 bdate mmddyy10.
        @23 allowance comma2.
        hobby1 $ hobby2 $ hobby3 $;
run;
```

- The DATA statement can create temporary or permanent data sets.

6

...

INFILE Statement

With an INPUT statement, the INFILE statement identifies the physical name of the external file to read.

```
data work.kids;
  infile 'kids.dat'; Input Raw Data File
  input name $ 1-8 siblings 10
    @12 bdate mmddyy10.
    @23 allowance comma2.
    hobby1 $ hobby2 $ hobby3 $;
run;
```

- The physical name is the name that the operating environment uses to access the file.

7

...

INPUT Statement

The INPUT statement describes the arrangement of values in the input data record and assigns input values to the corresponding SAS variables.

```
data work.kids;
  infile 'kids.dat';
  input name $ 1-8 siblings 10
    @12 bdate mmddyy10.
    @23 allowance comma2.
    hobby1 $ hobby2 $ hobby3 $;
run;
```

8

INPUT Statement

Which of the following is **not** an input style for the INPUT statement?

- A. list input
- B. column input
- C. delimited input
- D. formatted input

9

INPUT Statement

----- -----10----- -----20----- -----30----- -----40----- -----50-----
Chloe 2 11/10/1995 \$5Running Music Gymnastics
Travis 2 1/30/1998 \$2Baseball Nintendo Reading
Jennifer 0 8/21/1999 \$0Soccer Painting Dancing

Input Raw Data File

The following three ways can describe a record's values in the INPUT statement:

- column input
- formatted input
- list input

```
input name $ 1-8 siblings 10 ← column
      @12 bdate mmddyy10. ←
      @23 allowance comma2. ← formatted
      hobby1 $ hobby2 $ hobby3 $; ← list
```

11

Column Input

With column input, the column numbers that contain the value follow a variable name in the INPUT statement.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with column input, data values

- must be in the same columns in all the input data records
- must be in standard form.

12

Formatted Input

With formatted input, an informat follows a variable name and defines how SAS reads the values of this variable.

An informat gives the data type and the field width of an input value.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with formatted input, data values

- must be in the same columns in all the input data records
- can be in standard or nonstandard form.

13

List Input

With list input, variable names in the INPUT statement are specified in the same order that the fields appear in the input data records.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with list input, data values

- must be separated with a delimiter
- can be in standard or nonstandard form.

14

Column, Formatted, and List Input

Q

```
input @45 name $10;
```

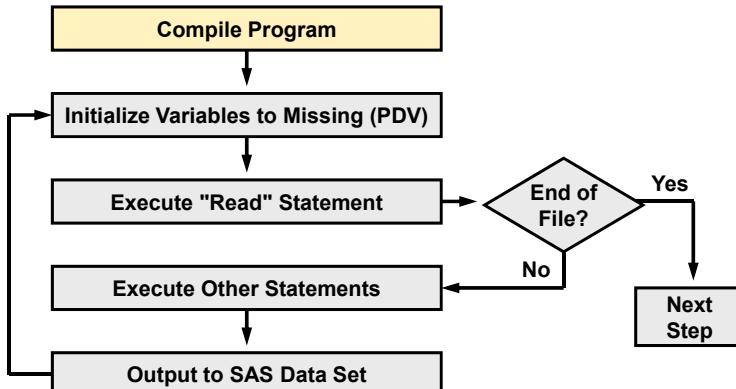

Which input technique is used in the above statement?

- A. column input
- B. formatted input
- C. list input

15

DATA Step Execution

When a DATA step is submitted, it is first **compiled** and then **executed**.

17

Compilation Phase

```

data work.kids;
  infile 'kids.dat';
  input name $ 1-8 siblings 10
         @12 bdate mmddyy10.
         @23 allowance comma2.
         hobby1 $ hobby2 $ hobby3 $;
run;
  
```

Chloe 2 11/10/1995 \$5Running Music Gymnastics
 Travis 2 1/30/1998 \$2Baseball Nintendo Reading
 Jennifer 0 8/21/1999 \$0Soccer Painting Dancing

Input Raw Data File

Input Buffer:

PDV:

name \$ 8	siblings N 8	bdate N 8	allowance N 8	hobby1 \$ 8	hobby2 \$ 8	hobby3 \$ 8	_ERROR_ N 8	N N 8

18

Compilation Phase

What third item is created at compile time in addition to the input buffer and the program data vector (PDV)?

- A. report
 - B. data values
 - C. raw data file
 - D. descriptor information

19

Execution Phase

```
data work.kids;
  infile 'kids.dat';
  input name $ 1-8 siblings 10
        @12 bdate mmddyy10.
        @23 allowance comma2.
        hobby1 $ hobby2 $ hobby3 $;
run;
```

Chloe	2	11/10/1995	\$5	Running	Music	Gymnastics	
Travis	2	1/30/1998	\$2	Baseball	Nintendo	Reading	Inp
Jennifer	0	8/21/1999	\$0	Soccer	Painting	Dancing	

Input Raw Data File

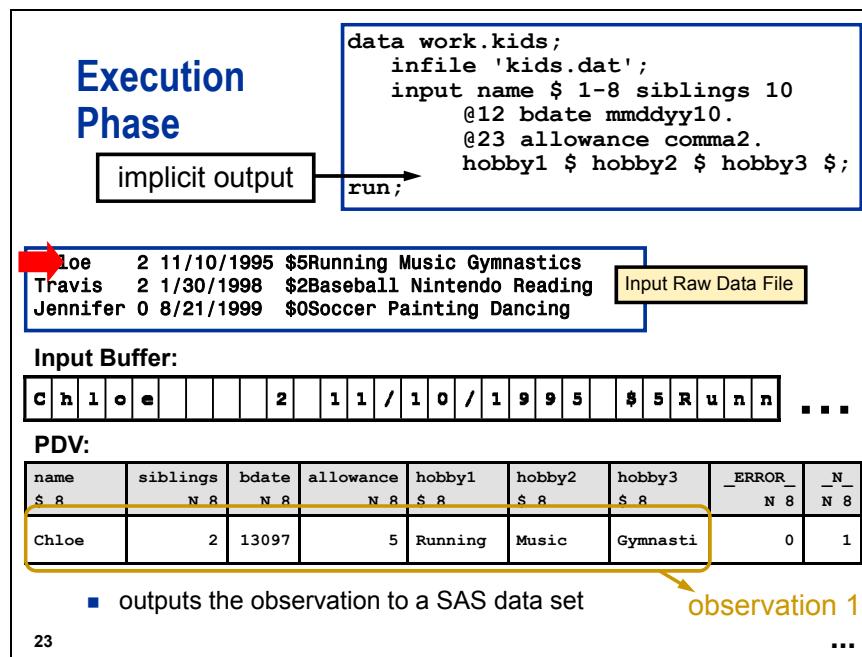

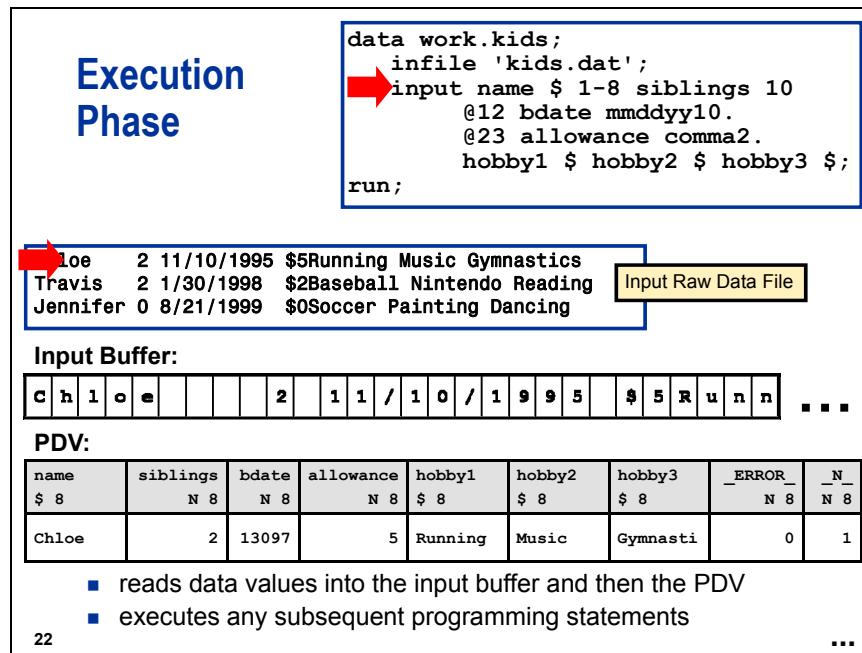

Input Buffer:

.....

PDV:

- initializes the PDV to missing and sets the initial values of N and ERROR

21

Execution Phase

```
data work.kids;
  infile 'kids.dat';
  input name $ 1-8 siblings 10
         @12 bdate mmddyy10.
         @23 allowance comma2.
         hobby1 $ hobby2 $ hobby3 $;
run;
```

Input Raw Data File

Joe	2	11/10/1995	\$5	Running	Music	Gymnastics		
Travis	2	1/30/1998	\$2	Baseball	Nintendo	Reading		
Jennifer	0	8/21/1999	\$0	Soccer	Painting	Dancing

2	Travis	2	13909	2	Baseball	Nintendo	Reading
3	Jennifer	0	14477	0	Soccer	Painting	Dancing

29

Data Errors

A data error is when the INPUT statement encounters invalid data in a field.

When SAS encounters a data error, these events occur:

- A note that describes the error is printed in the SAS log.
- The input record (contents of the input buffer) being read is displayed in the SAS log.
- The values in the SAS observation (contents of the PDV) being created are displayed in the SAS log.
- A missing value is assigned to the appropriate SAS variable.
- Execution continues.

30

Data Errors

```
data work.kids1;
  infile 'kids1.dat';
  input name $ 1-8 siblings 10
    @12 bdate mmddyy10.
    @23 allowance comma2.
    hobby1 $ hobby2 $ hobby3 $;
run;
```

hobby2=Painting hobby3=Dancing _ERROR_=1 _N_=3

```

33

DATALINES Statement

The DATALINES statement can be used with an INPUT statement to read data directly from the program, rather than data stored in a raw data file.

```

data work.kids;
  input name $ 1-8 siblings 10
    @12 bdate mmddyy10.
    @23 allowance comma2.
    hobby1 $ hobby2 $ hobby3 $;
  →datalines;
Chloe   2 11/10/1995 $5Running Music Gymnastics
Travis   2 1/30/1998 $2Baseball Nintendo Reading
Jennifer 0 8/21/1999 $0Soccer Painting Dancing
;
run;

```

35

DATALINES Statement

Which statement is **false** concerning the DATALINES statement?

- A. Multiple DATALINES statements can be used in a DATA step.
- B. A null statement (a single semicolon) is needed to indicate the end of the input data.
- C. The DATALINES statement is the last statement in the DATA step and immediately precedes the first data line.

Refer to Exercise 1 for Chapter 3 in Appendix A.

3.2 Reading Raw Data Files: Part 2

Column Input

With column input, the column numbers that contain the value follow a variable name in the INPUT statement.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with column input, data values

- must be in the same columns in all the input data records
- must be in standard form.

41

Column Input

- Standard data is any data that SAS can read without any special instructions.
- Examples of standard numeric data:

58 -23 67.23 00.99 5.67E5 1.2E-2

A column INPUT statement can contain the following:

variable	names a variable that is assigned input values.
\$	indicates to store a variable value as a character value rather than as a numeric value.
start-column	specifies the first column of the input record that contains the value to read.
- end-column	specifies the last column of the input record that contains the value to read.

42

Column Input

	10	20	30	40	50	
Chloe	2	11/10/1995	\$5	Running	Music	Gymnastics
Travis	2	1/30/1998	\$2	Baseball	Nintendo	Reading
Jennifer	0	8/21/1999	\$0	Soccer	Painting	Dancing

Input Raw Data File

```
data work.kids2;
  infile 'kids2.dat';
  input name $ 1-8
  siblings 10
  bdate $ 12-21
  allowance $ 23-24
  hobby1 $ 26-35
  hobby2 $ 36-45
  hobby3 $ 46-55;
run;
```

43

Column Input

Q

```
input name $ 1-8
  siblings 10
  bdate $ 12-21
  allowance $ 23-24
  hobby1 $ 26-35
  hobby2 $ 36-45
  hobby3 $ 46-55;
```

How many variables are numeric and ideally how many variables should be numeric?

- A. 1 numeric variable and 2 variables should be numeric.
- B. 1 numeric variable and 3 variables should be numeric.
- C. 2 numeric variables and 2 variables should be numeric.
- D. 3 numeric variables and 3 variables should be numeric.

44

Formatted Input

With formatted input, an informat follows a variable name and defines how SAS reads the values of this variable. An informat gives the data type and the field width of an input value.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with formatted input, data values

- must be in the same columns in all the input data records
- can be in standard or nonstandard form.

46

Formatted Input

- Nonstandard data* is any data that SAS cannot read without a special instruction.
- Examples of nonstandard numeric data:

5,823 (23) \$67.23 01/30/1999 12MAY06

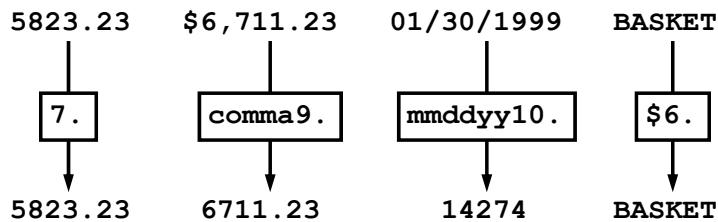

A formatted INPUT statement can contain the following:

pointer-control	moves the input pointer to a specified column in the input buffer.
	<code>@n</code> moves the pointer to column <i>n</i> .
	<code>+n</code> moves the pointer <i>n</i> columns.
variable	names a variable that is assigned input values.
informat	specifies a SAS informat to use to read the variable values.

47

Informats

An *informat* is an instruction that SAS uses to read data values into a variable.

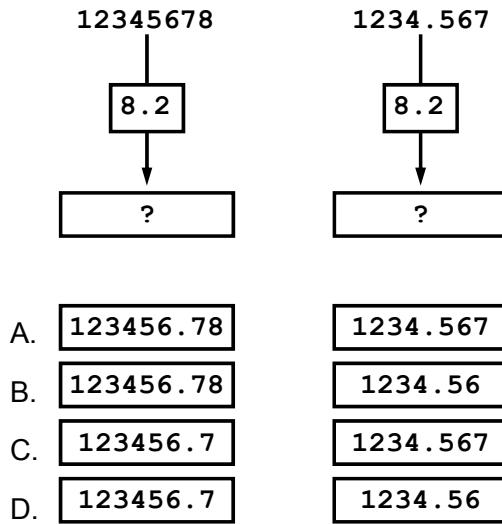

SAS uses the informat to determine the following:

- whether the variable is numeric or character
- the length of character variables

48

Informats

Q

49

Informats

Which statement is **false** regarding informats?

- A. When you use an informat, the informat contains a period (.) as a part of the name.
- B. The \$ indicates a character informat and the absence of a \$ indicates a numeric informat.
- C. An informat has a default width or specifies a width, which is the number of columns to read in the input data.
- D. When a problem occurs with a valid informat, SAS writes a note to the SAS log, assigns a missing value to the variable, and terminates the DATA step.

51

Formatted Input

-----	-----10-----	-----20-----	-----30-----	-----40-----	-----50-----	-----
Chloe	2	11/10/1995	\$5	Running	Music	Gymnastics
Travis	2	1/30/1998	\$2	Baseball	Nintendo	Reading
Jennifer	0	8/21/1999	\$0	Soccer	Painting	Dancing

Input Raw Data File

```

data work.kids2;
  infile 'kids2.dat';
  input @1 name $8.
    @10 siblings 1.
    @12 bdate mmddyy10.
    @23 allowance comma2.
    @26 hobby1 $10.
    @36 hobby2 $10.
    @46 hobby3 $10.;

run;

```

53

Q

Formatted Input

```
input @1 name $8.
      @10 siblings 1.
      @12 bdate mmddyy10.
      @23 allowance comma2.
      @26 hobby1 $10.
      @36 hobby2 $10.
      @46 hobby3 $10.;
```

What is the byte size of **bdate** and **hobby1**?

- A. **bdate** = 8 and **hobby1** = 8
- B. **bdate** = 8 and **hobby1** = 10
- C. **bdate** = 10 and **hobby1** = 8
- D. **bdate** = 10 and **hobby1** = 10

54

List Input

With list input, variable names in the INPUT statement are specified in the same order that the fields appear in the input data records.

```
input name $ 1-8 siblings 10
      @12 bdate mmddyy10.
      @23 allowance comma2.
      hobby1 $ hobby2 $ hobby3 $;
```

To read with list input, data values

- must be separated with a delimiter
- can be in standard or nonstandard form.

56

List Input

- You must specify the variables in the order that they appear in the raw data file, left to right.
- The default length for variables is eight bytes.
- A space (blank) is the default delimiter.

pointer control moves the input pointer to a specified column in the input buffer.

variable names a variable that is assigned input values.

\$ indicates to store a variable value as a character value rather than as a numeric value.

: reads data values that need the additional instructions that informats can provide but are not aligned in columns.

informat specifies an informat to use to read the variable values.

57

List Input

Chloe 2 11/10/1995 \$5 Running Music Gymnastics
 Travis 2 1/30/1998 \$2 Baseball Nintendo Reading
 Jennifer 0 8/21/1999 \$0 Soccer Painting Dancing

Input Raw Data File

```
data work.kids3;
  length hobby1 hobby2 hobby3 $ 10;
  infile 'kids3.dat';
  input name $
        siblings
        bdate : mmddyy10.
        allowance : comma2.
        hobby1 $
        hobby2 $
        hobby3 $;
  run;
```

The LENGTH statement specifies the number of bytes for storing variables.

58

...

List Input

```
Chloe 2 11/10/1995 $5 Running Music Gymnastics
Travis 2 1/30/1998 $2 Baseball Nintendo Reading
Jennifer 0 8/21/1999 $0 Soccer Painting Dancing
```

Input Raw Data File

```
data work.kids3;
length hobby1 hobby2 hobby3 $ 10;
infile 'kids3.dat';
input name $ ← character
      siblings ←
      bdate : mmddyy10. ← numeric
      allowance : comma2. ←
      hobby1 $ ←
      hobby2 $ ← character
      hobby3 $; ←
run;
```

59

...

List Input

```
Chloe 2 11/10/1995 $5 Running Music Gymnastics
Travis 2 1/30/1998 $2 Baseball Nintendo Reading
Jennifer 0 8/21/1999 $0 Soccer Painting Dancing
```

Input Raw Data File

```
data work.kids3;
length hobby1 hobby2 hobby3 $ 10;
infile 'kids3.dat';
input name $ ←
      siblings ←
      bdate : mmddyy10. ←
      allowance : comma2. ←
      hobby1 $ ←
      hobby2 $ ←
      hobby3 $; ←
run;
```

The : modifier with an informat is used to read numeric values that contain nonstandard values.

60

List Input

```
Chloe 2 11/10/1995 $5 Running Music Gymnastics
Travis 2 1/30/1998 $2 Baseball Nintendo Reading
Jennifer 0 8/21/1999 $0 Soccer Painting Dancing
```

Input Raw Data File

```
data work.kids3;
  infile 'kids3.dat';
  input name $
  siblings
  bdate : mmddyy10.
  allowance : comma2.
  hobby1 : $10. ←
  hobby2 : $10. ←
  hobby3 : $10.; ←
run;
```

The : modifier with an informat can also be used to control the byte size of character variables.

61

: Modifier with an Informat

A : modifier with an informat enables SAS to do the following:

- treat the current field as a delimited field
- apply an informat to the field ignoring the width

```
input name $ salary:comma10. state $;
```

list input

```
input name $ salary comma10. state $;
```

formatted input

62

: Modifier with an Informat

----|----10----|----20
 Ted \$2,345 Georgia
 Sam \$222,345 Florida

Input Raw Data File

```

What is the result of **state** based on the above INPUT statement?

A. Georgia
Florida

B. orgia
Florida

C. rgia
Florida

66

DLM= Option

The DLM= option specifies a delimiter to be used for list input. Blank is the default delimiter.

```
Chloe,2,11/10/1995,$5,Running,Music,Gymnastics
Travis,2,1/30/1998,$2,Baseball,Nintendo,Reading
Jennifer,0,8/21/1999,$0,Soccer,Painting,Dancing
```

Input Raw Data File

```
data work.kids4;
  infile 'kids4.dat' dlm=',';
  input name $
        siblings
        bdate : mmddyy10.
        allowance : comma2.
        hobby1 : $10.
        hobby2 : $10.
        hobby3 : $10.;

run;
```

68

Missing Data

By default, SAS treats two consecutive delimiters as one, not as a missing value between the delimiters.

```
Chloe,,1/10/1995,,Running,Music,Gymnastics
Travis,2,1/30/1998,$2,Baseball,Nintendo,Reading
Jennifer,0,8/21/1999,$0,Soccer,Painting,Dancing
```

Input Raw Data File

```
data work.kids5;
  infile 'kids5.dat' dlm=',';
  input name $
        siblings
        bdate : mmddyy10.
        allowance : comma2.
        hobby1 : $10.
        hobby2 : $10.
        hobby3 : $10.;

run;
```

69

Missing Data

```
Chloe,,11/10/1995,,Running,Music,Gymnastics
Travis,2,1/30/1998,$2,Baseball,Nintendo,Reading
Jennifer,0,8/21/1999,$0,Soccer,Painting,Dancing
```

Input Raw Data File

VIEWTABLE: Work.Kids5								Output Data Set
	name	siblings	bdate	allowance	hobby1	hobby2	hobby3

name=Chloe siblings=. bdate=. allowance=. hobby1=Gymnastics
hobby2=Travis hobby3=2 _ERROR_=1 _N_=1
NOTE: 3 records were read from the infile 'kids5.dat'.
      The minimum record length was 43.
      The maximum record length was 47.
NOTE: SAS went to a new line when INPUT statement reached past
      the end of a line.
```

70

DSD Option

The DSD option can do the following:

- treat two consecutive delimiters as a missing value
- remove quotation marks from strings and treat any delimiter inside the quotation marks as a valid character
- set the default delimiter to a comma

```
data work.kids5;
  infile 'kids5.dat' dsd;
  input name $  
        siblings  
        bdate : mmddyy10.  
        allowance : comma2.  
        hobby1 : $10.  
        hobby2 : $10.  
        hobby3 : $10.;
```

71

DSD Option

Chloe,11/10/1995,,Running,Music,Gymnastics
Travis,2,1/30/1998,\$2,Baseball,Nintendo,Reading
Jennifer,0,8/21/1999,\$0,Soccer,Painting,Dancing

NOTE: 3 records were read from the infile 'kids5.dat'.
The minimum record length was 43.

The maximum record length was 47.

NOTE: The data set WORK.KIDS5 has 3 observations and 7 variables.

NOTE: DATA statement used (Total process time):
real time 0.10 seconds
cpu time 0.02 seconds

72

DSD Option

Chloe/2/"11/10/1995"/\$5/Running/Music/Gymnastics
 Travis/2/"1/30/1998"/\$2/Baseball/Nintendo/Reading
 Jennifer/0/"8/21/1999"/Soccer/Painting/Dancing

Q
Input Raw Data File

quoted values missing data / delimiter

Which statement will correctly read the raw data file?

- A. `infile 'kids5a.dat' dsd;`
- B. `infile 'kids5a.dat' dlm='/' ;`
- C. `infile 'kids5a.dat' dsd dlm='/' ;`
- D. `infile 'kids5a.dat' dsd, dlm='/' ;`

73

Varying Number of Fields per Record

A raw data file might have a varying number of fields per record.

Chloe 2 11/10/1995 \$5 Running Music Gymnastics
 Travis 2 1/30/1998 \$2 Baseball Nintendo
 Jennifer 0 8/21/1999 \$0 Soccer

Input Raw Data File

VIEWTABLE: Work.Kids6							Output Data Set	
	name	siblings	bdate	allowance	hobby1	hobby2	hobby3	
1	Chloe	2	13097	5	Running	Music	Gymnastics	
2	Travis	2	13909	2	Baseball	Nintendo	Jennifer	

NOTE: 3 records were read from the infile 'kids6.dat'.
 The minimum record length was 30.

The maximum record length was 46.

NOTE: SAS went to a new line when INPUT statement reached past the end of a line.

NOTE: The data set WORK.KIDS6 has 2 observations and 7 variables.

75

MISOVER Option

The MISOVER option prevents an INPUT statement from reading a new input data record if it does not find values in the current input line for all the variables in the statement.

```
data work.kids6;
  infile 'kids6.dat' missover;
  input name $  

        siblings  

        bdate : mmddyy10.  

        allowance : comma2.  

        hobby1 : $10.  

        hobby2 : $10.  

        hobby3 : $10.;  

  run;
```

76

MISOVER Option

When an INPUT statement reaches the end of the current input data record, variables without any values assigned are set to missing with the MISOVER option.

VIEWTABLE: Work.Kids6								Output Data Set
	name	siblings	bdate	allowance	hobby1	hobby2	hobby3	
1	Chloe	2	13097	5	Running	Music	Gymnastics	
2	Travis	2	13909	2	Baseball	Nintendo		
3	Jennifer	0	14477	0	Soccer			

77

Refer to Exercise 2 for Chapter 3 in Appendix A.

3.3 Controlling When a Record Loads

Multiple INPUT Statements

By default, SAS advances the pointer to column 1 of the next input record when SAS encounters an INPUT statement.

```
data work.kids8;
  infile 'kids8.dat';
  input name $ 1-8
        siblings 10;
  input @1 bdate mmddyy10.
        @12 allowance comma2.;
  input hobby1:$10.
        hobby2:$10.
        hobby3:$10..;
run;
```

Input Raw Data File

Chloe	2	
11/10/1995	\$5	
Running	Music	Gymnastics
Travis	2	
1/30/1998	\$2	
Baseball	Nintendo	Reading
Jennifer	0	
8/21/1999	\$0	
Soccer	Painting	Dancing

81

Multiple INPUT Statements

```
data work.kids8;
  infile 'kids8.dat';
  input name $ 1-8
  siblings 10;
  input @1 bdate mmddyy10.
  @12 allowance comma2.;
  input hobby1:$10.
  hobby2:$10.
  hobby3:$10..;
run;
```

Input Raw Data File

Chloe	2	
11/10/1995	\$5	
Running	Music	Gymnastics
Travis	2	
1/30/1998	\$2	
Baseball	Nintendo	Reading
Jennifer	0	
8/21/1999	\$0	
Soccer	Painting	Dancing

Q

82

Which statement is **false**?

- A. The DATA step iterates nine times.
- B. The data set **work.kids8** will have three observations.
- C. Three records are read each DATA step iteration.
- D. One observation is created with each DATA step iteration.

Multiple INPUT Statements

```
data work.kids8;
  infile 'kids8.dat';
  input name $ 1-8
        siblings 10;
  input @1 bdate mmddyy10.
        @12 allowance comma2. ;
  input hobby1:$10.
        hobby2:$10.
        hobby3:$10.;

run;
```

Input Raw Data File

Chloe	2	
11/10/1995	\$5	
Running	Music	Gymnastics
Travis	2	
1/30/1998	\$2	
Baseball	Nintendo	Reading
Jennifer	0	
8/21/1999	\$0	
Soccer	Painting	Dancing

VIEWTABLE: Work.Kids8

Output Data Set

	name	siblings	bdate	allowance	hobby1	hobby2	hobby3
1	Chloe	2	13097	5	Running	Music	Gymnastics
2	Travis	2	13909	2	Baseball	Nintendo	Reading
3	Jennifer	0	14477	0	Soccer	Painting	Dancing

84

Line-Pointer Controls

The / line-pointer control advances the pointer to column 1 of the next input record.

```
data work.kids8;
  infile 'kids8.dat';
  input name $ 1-8
        siblings 10
        / @1 bdate mmddyy10.
        @12 allowance comma2.
        / hobby1:$10.
        hobby2:$10.
        hobby3:$10.;

run;
```

85

Line-Pointer Controls

The `#n` line-pointer control advances the pointer to column 1 of record *n*.

```
data work.kids8;
  infile 'kids8.dat';
  input #1 name $ 1-8
        siblings 10
        #2 @1 bdate mmddyy10.
        @12 allowance comma2.
  #3 hobby1:$10.
  hobby2:$10.
  hobby3:$10. ;
run;
```

86

Line-Pointer Controls

Yes or No: Do the following three sections produce the same results?

Q

Input Raw Data File	
Chloe	2
11/10/1995	\$5
Running Music Gymnastics	
Travis	2
1/30/1998	\$2
Baseball Nintendo Reading	
Jennifer	0
8/21/1999	\$0
Soccer Painting Dancing	

```
input name $ 1-8 siblings 10 //
      hobby1:$10. hobby2:$10. hobby3:$10. ;
```

```
input #1 name $ 1-8 siblings 10
      #3 hobby1:$10. hobby2:$10. hobby3:$10. ;
```

```
input name $ 1-8 siblings 10;
input;
input hobby1:$10. hobby2:$10. hobby3:$10. ;
```

87

Line-Pointer Controls

The second record is skipped in each iteration of the DATA step.

```
input name $ 1-8 siblings 10 //  
      hobby1:$10. hobby2:$10. hobby3:$10.;
```

```
input #1 name $ 1-8 siblings 10  
      #3 hobby1:$10. hobby2:$10. hobby3:$10.;
```

```
input name $ 1-8 siblings 10;  
input;  
input hobby1:$10. hobby2:$10. hobby3:$10.;
```

VIEWTABLE: Work.Kids8					Output Data Set
	name	siblings	hobby1	hobby2	hobby3
1	Chloe	2	Running	Music	Gymnastics
2	Travis	2	Baseball	Nintendo	Reading
3	Jennifer	0	Soccer	Painting	Dancing

89

The Single Trailing @

The single trailing @ has the following characteristics:

- holds an input record for the execution of the next INPUT statement within the same iteration of the DATA step
- is useful when you must read from a record multiple times

Chloe IN 11/10/1995 \$5Running Music Gymnastics	Input Raw Data File
Travis IL Baseball Nintendo Reading	
Jennifer IN 8/21/1999 \$0Soccer Painting Dancing	

This raw data file has different layouts
depending on the value of **state**.

90

The Single Trailing @

Input Raw Data File

```

Chloe  IN 11/10/1995 $5Running Music Gymnastics
Travis  IL Baseball Nintendo Reading
Jennifer IN 8/21/1999 $0Soccer Painting Dancing

```

```

data work.kids9;
  infile 'kids9.dat';
  input name $ 1-8 state $ 10-11 @;
  if state='IN' then
    input @13 bdate mmddyy10. @24 allowance comma2.
      hobby1:$10. hobby2:$10. hobby3:$10. ;
  else input @13 hobby1:$10. hobby2:$10. hobby3:$10. ;
run;

```

VIEWTABLE: Work.Kids9

Output Data Set

	name	state	bdate	allowance	hobby1	hobby2	hobby3
1	Chloe	IN	13097	5	Running	Music	Gymnastics
2	Travis	IL	.	.	Baseball	Nintendo	Reading
3	Jennifer	IN	14477	0	Soccer	Painting	Dancing

91

The Single Trailing @

Which statement is **false** concerning the single trailing @?

- In the INPUT statement, the single trailing @ must be the last item before the semicolon.
- SAS releases a record held by a single trailing @ when an INPUT statement without a trailing @ executes.
- The single trailing @ prevents the next INPUT statement from automatically releasing the current input record.
- The single trailing @ holds the input record for the execution of the next INPUT statement across iterations of the DATA step.

92

The Double Trailing @

The double trailing @ has the following characteristics:

- holds the input record for the execution of the next INPUT statement across iterations of the DATA step
- is useful when each input line contains values for several observations

Input Raw Data File

```
Chloe IN Travis IL Jennifer IN
Brian IL Mark IN Kurt IN Hannah IL
```

94

The Double Trailing @

Input Raw Data File

```
Chloe IN Travis IL Jennifer IN
Brian IL Mark IN Kurt IN Hannah IL
```

```
data work.kids10;
  infile 'kids10.dat';
  input name $ state $ @@;
run;
```

Output Data Set

VIEWTABLE: Work.Kids10

	name	state
1	Chloe	IN
2	Travis	IL
3	Jennifer	IN
4	Brian	IL
5	Mark	IN
6	Kurt	IN
7	Hannah	IL

NOTE: 2 records were read from the infile 'kids10.dat'.
 The minimum record length was 30.
 The maximum record length was 34.

NOTE: SAS went to a new line when INPUT statement reached past the
 end of a line.

NOTE: The data set WORK.KIDS10 has 7 observations and 2 variables.

95

The Double Trailing @

Which statement is **false** concerning the double trailing @?

- A. The double trailing @ must be the first item in the INPUT statement.
- B. The double trailing @ is useful when one record contains several observations.
- C. The double trailing @ holds a record for the next INPUT statement across iterations of the DATA step.
- D. SAS releases the record that is held by a double trailing @ if the pointer moves past the end of the input record.

Refer to Exercise 3 for Chapter 3 in Appendix A.

3.4 Reading Microsoft Excel Files

SAS/ACCESS LIBNAME Statement

With the SAS/ACCESS Interface to PC File Formats, the LIBNAME statement can be used to access Microsoft Excel workbooks.

```
libname myxls 'customers.xls';
proc contents data=myxls._all_;
run;
```

This enables you to reference a worksheet directly in a DATA step or SAS procedure, and to read from and write to an Excel worksheet as if it were a SAS data set.

101

SAS/ACCESS LIBNAME Statement

How do you reference the **females** worksheet in the Excel workbook **customer** based on the following LIBNAME statement?

```
libname myxls 'customers.xls';
```

- A. **myxls.females\$**
- B. **customer.females**
- C. **myxls.'females\$'n**
- D. **customer.'females'n**

102

SAS/ACCESS LIBNAME Statement

Worksheet names appear with a dollar sign at the end of the name.

The CONTENTS Procedure

Directory

Libref	MYXLS
Engine	EXCEL
Physical Name	customers.xls
User	Admin

DBMS

#	Name	Member Type	Member Type
1	Females\$	DATA	TABLE
2	Males\$	DATA	TABLE

104

SAS/ACCESS LIBNAME Statement

SAS name literals enable special characters to be included in data set names.

The CONTENTS Procedure

Data Set Name	MYXLS.'Females\$'n	Observations	.
Member Type	DATA	Variables	6
Engine	EXCEL	Indexes	0
Created	.	Observation Length	0
Last Modified	.	Deleted Observations	0
Protection		Compressed	NO
Data Set Type		Sorted	NO
Label			
Data Representation	Default		
Encoding	Default		

A *SAS name literal* is a name token that is expressed as a string within quotation marks, followed immediately by the letter n.

105

SAS/ACCESS LIBNAME Statement

If SAS has a library reference name assigned to an Excel workbook, the workbook cannot be opened in Excel.

```
libname myxls 'customers.xls';

proc contents data=myxls._all_;
run;

proc print data=myxls.'females$n';
run;

data work.usfemales;
  set myxls.'females$n';
  where country='US';
run;
```

106

SAS/ACCESS LIBNAME Statement

Q

Which statement disassociates the MYXLS library reference name?

- A. `libname myxls end;`
- B. `libname myxls clear;`
- C. `libname myxls close;`
- D. `libname myxls disassociate;`

107

Refer to Exercise 4 for Chapter 3 in Appendix A.

3.5 Answers to Questions

Question Slide Number	Answer
4	1. <code>kids.dat</code> 2. <code>work.kids</code>
9	C.
15	A.
19	D.
27	C.
33	The variable <code>hobby1</code> is being read in as numeric.
36	A.
44	B.
49	A.
51	D.
54	B.
64	B.

107	B.

Chapter 4 Creating Variables

4.1	Creating Variables with the Assignment Statement.....	4-3
4.2	Creating Variables Conditionally	4-9
4.3	Creating Accumulator Variables	4-20
4.4	Answers to Questions.....	4-27

4.1 Creating Variables with the Assignment Statement

Assignment Statement

The assignment statement evaluates an expression and stores the result in a new variable or an existing variable.

Examples:

```

name = 'Jane Doe';
revenue = 157900;
date = '10MAY2007'd;
total = price * quantity;
cityst = city !! state;
product = uppercase(product);
average = mean(jan, feb, mar);

```

variable

expression

Assignment statements evaluate the expression on the right side of the equal sign and store the result in the variable that is specified on the left side of the equal sign.

3

Q

Assignment Statement

Which assignment statement is overwriting a variable used in the expression?

1. `name = 'Jane Doe';`
2. `revenue = 157900;`
3. `date = '10MAY2007'd;`
4. `total = price * quantity;`
5. `cityst = city !! state;`
6. `product = uppercase(product);`
7. `average = mean(jan, feb, mar);`

4

Expression

The *expression* is a sequence of operands and operators that form a set of instructions that produce a value.

- *Operands* are
 - constants (character or numeric)
 - variables (character or numeric).
- *Operators* are
 - symbols that represent an arithmetic calculation or concatenation
 - a SAS function.

6

Operands

A *constant* is a number or a character string that indicates a fixed value.

```
name = 'Jane Doe';
revenue = 157900;
date = '10MAY2007'd;
```

Character
constants must be
enclosed in
quotation marks.

Character constants are enclosed in quotation marks, but names of variables are not enclosed in quotation marks.

```
total = price * quantity;
cityst = city !! state;
product = upcase(product);
average = mean(jan, feb, mar);
```

7

Operators

- Arithmetic operators indicate that an arithmetic calculation is performed.
- A concatenation operator concatenates character values.
- A SAS function performs a computation or system manipulation on arguments and returns a value.

```
total = price * quantity;
cityst = city !! state;
product = upcase(product);
average = mean(jan, feb, mar);
```

8

Arithmetic Operators

Possible arithmetic operators:

Symbol	Definition
**	exponentiation
*	multiplication
/	division
+	addition
-	subtraction

- If a missing value is an operand for an arithmetic operator, the result is a missing value.

9

Example

```
data newprice;
  set golf.supplies;
  saleprice = price * 0.75;
  saletype = '25% off';
  format price saleprice dollar8.2;
run;
```

VIEWTABLE: Golf.Supplies			
	mfg	type	price
1	Crew	Distance	8.1
2	Crew	Spin	8.25
3	Crew	Titanium	9.5
4	Hi-fly	X12000	13.75
5	Hi-fly	X22000	14.6
6	White	Strata	10.6
7	White	Aero	12.3
8	White	XL	14.5
9	White	Elite	16.4

10

VIEWTABLE: Work.Newprice					
	mfg	type	price	saleprice	saletype
1	Crew	Distance	\$8.10	\$6.08	25% off
2	Crew	Spin	\$8.25	\$6.19	25% off
3	Crew	Titanium	\$9.50	\$7.13	25% off
4	Hi-fly	X12000	\$13.75	\$10.31	25% off
5	Hi-fly	X22000	\$14.60	\$10.95	25% off
6	White	Strata	\$10.60	\$7.95	25% off
7	White	Aero	\$12.30	\$9.23	25% off
8	White	XL	\$14.50	\$10.88	25% off
9	White	Elite	\$16.20	\$12.15	25% off

Q

Example

```
data newprice;
  set golf.supplies;
  saleprice = price * 0.75;
  saletype = '25% off';
  format price saleprice dollar8.2;
run;
```

Which statement is **true** concerning the new variables?

- A. **saleprice** and **saletype** are numeric (8 bytes).
- B. **saleprice** and **saletype** are character (7 bytes).
- C. **saleprice** is numeric (8 bytes) and **saletype** is character (7 bytes).
- D. **saleprice** is numeric (8 bytes) and **saletype** is character (8 bytes).

11

Refer to Exercise 1 for Chapter 4 in Appendix A.

DROP and KEEP Statements

- The DROP statement specifies the names of the variables to omit from the output data set.
- The KEEP statement specifies the names of the variables to write to the output data set.

```
data newprice;
  set golf.supplies;
  drop type price; ← Placement of statement
  saleprice = price * 0.75; is irrelevant; statement
  saletype = '25% off';
  format saleprice dollar8.2;
run;
```

Partial Data Set

VIEWTABLE: Work.Newprice					
	mfg	type	price	saleprice	saletype
1	Crew	Distance	\$8.00	\$6.08	25% off
2	Crew	Spin	\$12.50	\$6.19	25% off
3	Crew	Titanium	\$9.50	\$7.13	25% off

16

DROP= and KEEP= Options

Which program is equivalent to the previous program?

A.

```
data newprice(drop=type price);
  set golf.supplies;
  saleprice = price * 0.75;
  saletype = '25% off';
  format saleprice dollar8.2;
run;
```

B.

```
data newprice;
  set golf.supplies(drop=type price);
  saleprice = price * 0.75;
  saletype = '25% off';
  format saleprice dollar8.2;
run;
```

17

DROP= and KEEP= Options

The DROP= data set option excludes the variables for

- processing if in the SET statement
- writing to the output data set if in the DATA statement.

The KEEP= data set option specifies the variables for

- processing if in the SET statement
- writing to the output data set if in the DATA statement.

```
data newprice(drop=price);
  set golf.supplies(keep=mfg price);
  saleprice = price * 0.75;
  saletype = '25% off';
  format saleprice dollar8.2;
run;
```

4.2 Creating Variables Conditionally

IF-THEN / ELSE Statements

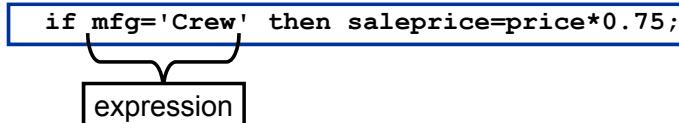

- The IF-THEN statement executes **a statement** for observations that meet specific conditions.
- The optional ELSE statement gives an alternative action if the THEN clause is not executed.

```
data newprice;
  set golf.supplies;
  if mfg='Crew' then saleprice=price*0.75;
  else if mfg='Hi-fly' then saleprice=price*0.70;
  else if mfg='White' then saleprice=price*0.90;
  format price saleprice dollar8.2;
run;
```

22

Expression

`if mfg='Crew' then saleprice=price*0.75;`

- The expression is any valid SAS expression and is a required argument.
- SAS evaluates the expression in an IF-THEN statement to produce a result that is either nonzero, zero, or missing.
- A nonzero and nonmissing result causes the expression to be true; a result of zero or missing causes the expression to be false.

23

Q

Expression

Examples:

city in ('New York', 'Boston')

salary ge 125000

upcase(last)='SMITH'

birth='12DEC1999'd

city='Atlanta' and salary<50000

revenue ne goal

Which expression is invalid in the IF-THEN statement?

A. if total then ...

B. if 12000<=revenue<=25000 then ...

C. if city='Reno' state='NV' then ...

D. if salary>75000 or bonus<5000 then ...

24

Statement

if mfg='Crew' then saleprice=price*0.75;

statement

The statement can be any executable SAS statement.

Examples:

status = 'Unknown'

count + 1

total = sum(num1, num2, num3)

delete

anniversary = '15AUG2006'd

output

26

ELSE Statements

```
if mfg='Crew' then saleprice=price*0.75;
else if mfg='Hi-fly' then saleprice=price*0.70;
else if mfg='White' then saleprice=price*0.90;
```

Yes or No: Is the word ELSE required each time in the above example?

27

ELSE Statements

```
if mfg='Crew' then saleprice=price*0.75;
else if mfg='Hi-fly' then saleprice=price*0.70;
else if mfg='White' then saleprice=price*0.90;
```

- Using IF-THEN statements **without** the ELSE statement causes SAS to evaluate all IF-THEN statements.
- Using IF-THEN statements **with** the ELSE statement causes SAS to execute the IF-THEN statements until SAS encounters the first true statement. Subsequent IF-THEN statements are not evaluated.

29

Q

ELSE Statements

```
if mfg='Crew' then saleprice=price*0.75;  
else if mfg='Hi-fly' then saleprice=price*0.70;  
else if mfg='White' then saleprice=price*0.90;
```

Based on the partial program above, what is the result if an observation has a value of **mfg='X-treme'**?

- A. The observation will be deleted.
- B. The observation will have a missing value for **saleprice**.
- C. The observation will have a **saleprice** equal to the **price** multiplied by 0.75.
- D. The observation will have a **saleprice** equal to the **price** multiplied by 0.90.

30

ELSE Statements

```
if mfg='Crew' then saleprice=price*0.75;  
else if mfg='Hi-fly' then saleprice=price*0.70;  
else saleprice=price*0.90;
```

The final ELSE statement can be coded without an IF-THEN statement to direct all previous FALSE conditions into the final condition.

32

IF-THEN DO / ELSE DO Statements

The IF-THEN DO statement executes **a group of statements** for observations that meet specific conditions.

```
...
if mfg='Crew' then do;
  pct=0.75;
  saleprice = price * pct;
  saletype = '25% off';
end;
else if mfg='Hi-fly' then do;
  pct=0.70;
  saleprice = price * pct;
  saletype = '30% off';
end;
else do;
  pct=0.90;
  saleprice = price * pct;
  saletype = '10% Storewide Sale';
end;
...

```

33

Refer to Exercise 2 for Chapter 4 in Appendix A.

IF-THEN DO / ELSE DO Statements

```
data newprice;
infile 'raw-data-file';
input mfg $ type $ price;
length saletype $ 18;
if mfg='Crew' then do;
  pct=0.75;
  saleprice = price * pct;
  saletype = '25% off';
end;
else if mfg='Hi-fly' then do;
  pct=0.70;
  saleprice = price * pct;
  saletype = '30% off';
end;
else do;
  pct=0.90;
  saleprice = price * pct;
  saletype = '10% Storewide Sale';
end;
format price saleprice dollar8.2;
run;
```

Conditional statements can be used in DATA steps that read raw data files or data sets.

1

2

3

36

IF-THEN DO / ELSE DO Statements

```

data newprice;
  infile 'raw-data-file';
  input mfg $ type $ price;
  length saletype $ 18;
  if mfg='Crew' then do;
    pct=0.75;
    saleprice = price * pct;
    saletype = '25% off';
  end;
  else if mfg='Hi-fly' then do;
    pct=0.70;
    saleprice = price * pct;
    saletype = '30% off';
  end;
  else do;
    pct=0.90;
    saleprice = price * pct;
    saletype = '10% Storewide Sale';
  end;
  format price saleprice dollar8.2;
run;

```

A LENGTH statement controls the byte size of **saletype**. Without the statement, byte size would be 7 (25% off).

Three variables are being created. **pct** and **saleprice** are numeric (8 bytes). **saletype** is character (18 bytes).

37

IF-THEN DO / ELSE DO Statements

```

data newprice;
  infile 'raw-data-file';
  input mfg $ type $ price;
  length saletype $ 18;
  if mfg='Crew' then do;
    pct=0.75;
    saleprice = price * pct;
    saletype = '25% off';
  end;
  else if mfg='Hi-fly' then do;
    pct=0.70;
    saleprice = price * pct;
    saletype = '30% off';
  end;
  else do;
    pct=0.90;
    saleprice = price * pct;
    saletype = '10% Storewide Sale';
  end;
  format price saleprice dollar8.2;
run;

```

All previous **false** conditions fall into the final condition.

38

IF-THEN DO / ELSE DO Statements

Which syntax is valid for IF-THEN DO statements?

- A.

```
if payclass='monthly' then do amt=salary;
else if payclass='hourly' then do amt=hrlywage*40;
```
- B.

```
if 12000<=revenue<=24000 then do; x='goal' end;
else if revenue<12000 then do; x='below' end;
else if revenue>24000 then do; x='above' end;
```
- C.

```
if salary>=100000 then do;
category='Exec'; range='Above 100K'; end;
else if salary<100000 then do;
category='Non-Exec'; range='Below 100K'; end;
```
- D.

```
if mon in ('JUN', 'JUL', 'AUG') then do;
status='SUMMER';
else if mon in ('MAR', 'APR', 'MAY') then do;
status='SPRING';
else do;
status='FALL OR WINTER';
```

39

SELECT / WHEN / OTHERWISE Statements

An alternative to IF-THEN statements is
SELECT / WHEN / OTHERWISE statements.

- The SELECT statement begins a SELECT group.
- SELECT groups contain WHEN statements that identify SAS statements that are executed when a particular condition is true.
- A SELECT group must use at least one WHEN statement.
- An optional OTHERWISE statement specifies a statement to be executed if no WHEN condition is met.
- An END statement ends a SELECT group.

41

SELECT / WHEN / OTHERWISE Statements

IF
THEN
ELSE

```
data newprice;
  set golf.supplies;
  if mfg='Crew' then
    saleprice=price*0.75;
  else if mfg='Hi-fly' then
    saleprice=price*0.70;
  else if mfg='White' then
    saleprice=price*0.90;
  format price saleprice dollar8.2;
run;
```

SELECT
group

```
data newprice;
  set golf.supplies;
  select(mfg);
    when('Crew') saleprice=price*0.75;
    when('Hi-fly') saleprice=price*0.70;
    when('White') saleprice=price*0.90;
  end;
  format price saleprice dollar8.2;
run;
```

42

SELECT / WHEN / OTHERWISE Statements

Q

```
select(mfg);
  when('Crew') saleprice=price*0.75;
  when('Hi-fly') saleprice=price*0.70;
  when('White') saleprice=price*0.90;
end;
```

Based on the partial program above, what is the result if an observation has a value of **mfg='X-treme'**?

43

SELECT / WHEN / OTHERWISE Statements

A null OTHERWISE statement prevents SAS from issuing an error message when all WHEN conditions are false.

```

ERROR: Unsatisfied WHEN clause and no
      OTHERWISE clause at line 618 column 3.
      mfg=X-treme type=Strata price=$10.60
      saleprice=._ERROR_=1 _N_=10

select(mfg);
  when('Crew') saleprice=price*0.75;
  when('Hi-fly') saleprice=price*0.70;
  when('White') saleprice=price*0.90;
end;

select(mfg);
  when('Crew') saleprice=price*0.75;
  when('Hi-fly') saleprice=price*0.70;
  when('White') saleprice=price*0.90;
  otherwise;
end;

```

45

no ERROR

```

...
if mfg='Crew' then do;
  pct=0.75;
  saleprice = price * pct;
  saletype = '25% off';
end;
else if mfg='Hi-f
  pct=0.70;
  saleprice = pr
  saletype = '30
end;
else do;
  pct=0.90;
  saleprice = pr
  saletype = '10
end;
...

```

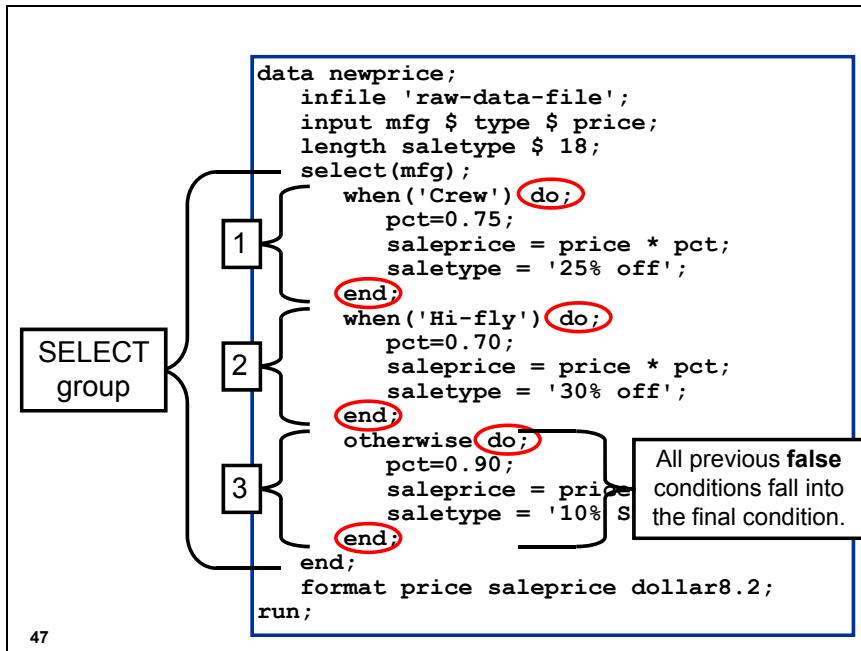

SELECT group

```

select(mfg);
  when('Crew') do;
    pct=0.75;
    saleprice = price * pct;
    saletype = '25% off';
  end;
  when('Hi-fly') do;
    pct=0.70;
    saleprice = price * pct;
    saletype = '30% off';
  end;
  otherwise do;
    pct=0.90;
    saleprice = price * pct;
    saletype='10% Storewide Sale';
  end;
...

```

46

SELECT / WHEN / OTHERWISE Statements

Additional examples:

```

select(payclass);
  when('monthly') amt=salary;
  when('hourly') amt=hrlywage*40;
  otherwise;
end;

select;
  when(12000<=revenue<=24000) target='goal';
  when(revenue<12000) target='below';
  when(revenue>24000) target='above';
  otherwise;
end;

select;
  when(mon in ('JUN', 'JUL', 'AUG') and temp>70)
    status='SUMMER';
  when(mon in ('MAR', 'APR', 'MAY'))
    status='SPRING';
  otherwise status='FALL OR WINTER';
end;

```

SELECT / WHEN / OTHERWISE Statements

```
data new;
  set rev;
  length target $ 5;
  select;
    when (12000<=revenue<=24000) target='goal';
    when (revenue<12000) target='below';
    when (revenue>=24000) target='above';
  otherwise;
  end;
run;
```

What is the value of **target** when **revenue=24000**?

- A. missing
- B. goal
- C. below
- D. above

4.3 Creating Accumulator Variables

Accumulator Variables

An *accumulator variable* is a variable that adds on an expression.

Partial Output

Maine County	Population 2000	Total Population	Total Counties
Androscoggin	103,793	103,793	1
Aroostook	73,938	177,731	2
Cumberland	265,612	443,343	3
Franklin	29,467	472,810	4
Hancock	51,791	524,601	5
Kennebec	117,114	641,715	6
Knox	39,618	681,333	7
Lincoln	33,616	714,949	8
Oxford	54,755	769,704	9
Penobscot	144,919	914,623	10

accumulator variables

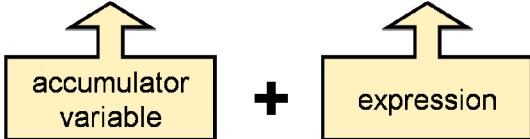

52

Sum Statement

The *sum statement* adds the result of an expression to an accumulator variable.

Examples:

```
TotCounties + 1;
TotPopulation + Population2000;
```

53

Sum Statement

The accumulator variable has the following characteristics:

- must be a numeric variable
- is automatically set to 0 before SAS reads the first observation
- is retained from one iteration to the next

The expression is defined with the following features:

- is any SAS expression
- is evaluated and the result added to the accumulator variable
- is ignored if missing

54

Sum Statement

The sum statement is equivalent to using the RETAIN statement and the SUM function.

```

TotPopulation + Population2000;

retain TotPopulation 0;
TotPopulation =
  sum(TotPopulation,Population2000);

```

- The RETAIN statement causes a variable to retain its value from one iteration of the DATA step to the next and specifies an initial value for the variable.
- The SUM function returns the sum of the nonmissing arguments.

55

Q

Sum and RETAIN Statements

Yes or No: Is the RETAIN statement ever needed with the sum statement?

56

RETAIN Statement

To initialize an accumulator variable to a value other than zero, include the accumulator variable in a RETAIN statement with an initial value.

	Population	Year
1	914950	1950
2	940841	1955
3	970689	1960
4	993236	1965
5	997357	1970
6	1062640	1975
7	1125027	1980
8	1163850	1985
9	1227928	1990

```
data FiveYearPop;
  set FiveYearPop;
  retain year 1945;
  year+5;
run;
```

58

Accumulator Variable for BY Groups

In order to create an accumulator variable for BY groups, the beginning and end of each BY group must be determined.

County	Town	Population	Total Population
Androscoggin	Auburn	23203	23203
Androscoggin	Lewiston	35690	58893
Cumberland	Brunswick	21172	21172
Cumberland	Portland	64249	85421
Cumberland	Scarborough	16970	102391
Cumberland	South Portland	23324	125715
Kennebec	Augusta	18560	18560
Penobscot	Bangor	31473	31473
York	Biddeford	20942	20942
York	Sanford	20806	41748

accumulator variable by County

59

BY-Group Processing

In the DATA step, SAS identifies the beginning and end of each BY group by creating two temporary variables for each BY variable: the **FIRST.** and **LAST.** variables.

```
data TopCounties;
  set Top10Town;
  by County;
run;
```

Data must be sorted or indexed by **County**.
first.County and **last.County** are created.

These temporary variables are available for DATA step programming, but are not added to the output data set.

60

BY-Group Processing

- The **FIRST.** variable is set to 1 when an observation is the first in a BY group; otherwise, it equals 0.
- The **LAST.** variable is set to 1 when an observation is the last in a BY group; otherwise, it equals 0.

County	Population	first.County	last.County
Androscoggin	23203	1	0
Androscoggin	35690	0	1
Cumberland	21172	1	0
Cumberland	64249	0	0
Cumberland	16970	0	0
Cumberland	23324	0	1
Kennebec	18560	1	1

61

BY-Group Processing

Which of the following is **false**?

- first.County=1** and **last.County=0** means the observation is the first one in the BY group.
- first.County=0** and **last.County=1** means the observation is the last one in the BY group.
- first.County=0** and **last.County=0** means the observation is the first and the last one in the BY group.
- first.County=0** and **last.County=0** means the observation is neither the first nor the last one in the BY group.

62

BY-Group Processing

The following program resets the accumulator variable at the beginning of each BY group and outputs only at the end of each BY group.

```
data TopCounties;
  set Top10Town;
  by County;
  if first.County then TotalPopulation=0;
  TotalPopulation+Population;
  if last.County=1;
  keep County TotalPopulation;
run;
```

	County	TotalPopulation
1	Androscoggin	58893
2	Cumberland	125715
3	Kennebec	18560
4	Penobscot	31473
5	York	41748

64

Multiple BY-Group Variables

A **FIRST.** variable and a **LAST.** variable is created for each variable in the BY statement.

```
data CityDonate;
  set Donations;
  by State City;
run;
```

Data must be sorted or indexed by **State** and **City**.
first.State,
last.State,
first.City, and
last.City are created.

When you use more than one variable in the BY statement, a change in the primary variable forces the **LAST.** variable=1 for the secondary variable.

65

Refer to Exercise 3 for Chapter 4 in Appendix A.

Multiple BY-Group Variables

```
data CityDonate;
  set Donations;
  by State City;
  if first.City=1 then TotalDonation=0;
  TotalDonation+Donation;
  if last.City=1;
run;
```

	state	city	donation	TotalDonation
1	NC	Charlotte	4000	15000
2	NC	Greenville	3000	9000
3	SC	Greenville	2000	7000
4	SC	Pelzer	5000	5000

4.4 Answers to Questions

Question Slide Number	Answer
4	6.
11	C.
17	A.
24	C.
27	No
30	B.
39	C.
43	ERROR: Unsatisfied WHEN clause and no OTHERWISE clause.
49	B.
56	Yes
62	C.

Chapter 5 Manipulating Data

5.1	Using Functions to Manipulate Data.....	5-3
5.2	Converting Character and Numeric Data	5-34
5.3	Processing Data with DO Loops	5-41
5.4	Processing Data with Arrays	5-52
5.5	Answers to Questions.....	5-59

5.1 Using Functions to Manipulate Data

Functions

A SAS *function* performs a computation or system manipulation on arguments and returns a value.

SAS functions can be used in DATA step programming statements, in a WHERE expression, and in the REPORT procedure.

Functions by Category

Character	State and Zip Code	Special
Date and Time	Truncation	Descriptive Statistics

3

Character Functions

Character		
SUBSTR	CAT	INDEX
SCAN	CATS	FIND
LEFT	CATT	LOWCASE
RIGHT	CATX	UPCASE
TRIM	TRANWRD	PROPCASE

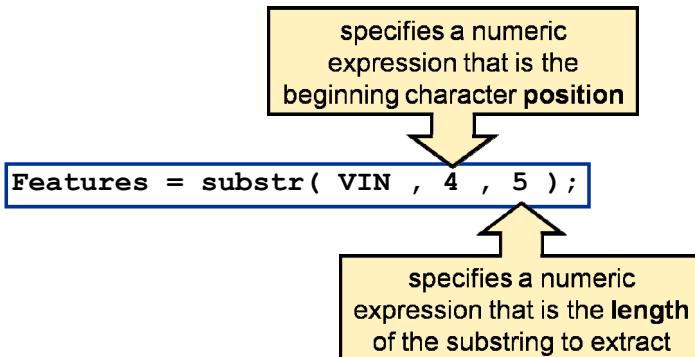

4

Refer to Exercise 1 for Chapter 5 in Appendix A.

SUBSTR Function

The *SUBSTR function* used to the right of the equal sign extracts a substring from an argument.

The SUBSTR function can be used to the left of the equal sign to replace character value constants.

7

SUBSTR Function

If the SUBSTR function returns a value to a variable that was not yet assigned a length, by default, the variable length is determined by the length of the first argument.

VIN (17 bytes)	Assignment Statement Using SUBSTR Function	New Variable (17 bytes)
	<code>Make = substr(VIN,2,1);</code>	F
<u>1E1JF27W86J178227</u>	<code>Features = substr(VIN,4,5);</code>	JF27W
	<code>SequenceNumber = substr(VIN,12);</code>	178227

If you omit the length, SAS extracts the remainder of the expression.

8

SUBSTR Function

The tenth position of a vehicle identification number represents the model year.

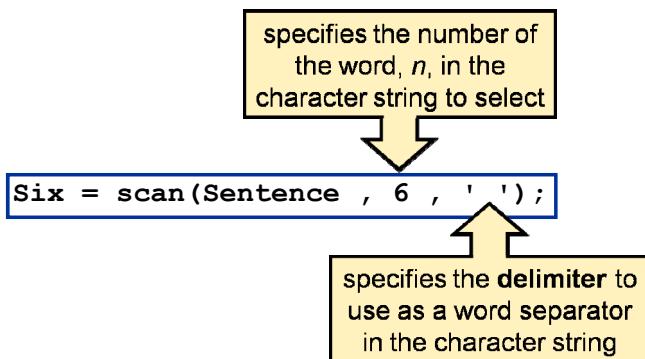

Which assignment statement correctly extracts only the tenth position of the vehicle identification number?

- A. `ModelYear = substr(VIN,1);`
- B. `ModelYear = substr(VIN,10);`
- C. `ModelYear = substr(VIN,1,10);`
- D. `ModelYear = substr(VIN,10,1);`

9

SCAN Function

The *SCAN* function selects a given word from a character expression.

11

SCAN Function

If the SCAN function returns a value to a variable that was not yet assigned a length, by default, the variable is assigned a length of 200.

SENTENCE (34 bytes)	
This is a test, a very short test.	
Assignment Statement Using the SCAN Function	New Variable (200 bytes)
<code>Six = scan(Sentence, 6, ' ');</code>	<code>very</code>
<code>Two = scan(Sentence, 2, ', ',');</code>	<code>a very short test.</code>

↑
leading blank

12

SCAN Function

Q

What must be added to the following program to control the byte size of the variables **Six** and **Two**?

```
data test;
  Sentence=
    'This is a test, a very short test.';
  Six=scan(Sentence,6,' ');
  Two=scan(Sentence,2,', ');
run;
```

13

SCAN Function

If you omit the delimiter, a default list of delimiters is used.

ASCII environment: blank . < (+ & ! \$ *) ; ^ - / , % |

EBCDIC environment: blank . < (+ & ! \$ *) ; - / , % | ¢

SENTENCE (36 bytes)		
<code>This+is an(ex-tremely)**crazy**test!</code>		
Assignment Statement Using the SCAN Function		New Variable (200 bytes)
<code>Two = scan(Sentence,2);</code>		<code>is</code>
<code>Four = scan(Sentence,4);</code>		<code>ex</code>

15

SCAN Function

- Leading delimiters before the first word in the character string do not affect the SCAN function.
- If there are two or more contiguous delimiters, the SCAN function treats them as one.
- If n is greater than the number of words in the character string, the SCAN function returns a blank value.
- If n is negative, the SCAN function selects the word in the character string starting from the end of the string.

16

Q

SCAN Function

What are the new variable values?

SENTENCE (38 bytes)	
\$%This+is an(ex-tremely)**crazy**test!	
Assignment Statement Using the SCAN Function	New Variable (200 bytes)
One = scan(Sentence,1);	
Six = scan(Sentence,6);	
Eight = scan(Sentence,8);	
MinusTwo = scan(Sentence,-2);	
Two = scan(Sentence,2,'*');	

17

LEFT and RIGHT Functions

- The *LEFT function* left-aligns a character expression.

LEFT returns an argument with leading blanks moved to the end of the value.

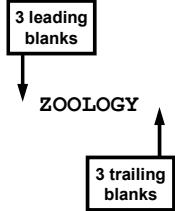

- The *RIGHT function* right-aligns a character expression.

RIGHT returns an argument with trailing blanks moved to the start of the value.

19

LEFT and RIGHT Functions

If the LEFT or RIGHT function returns a value to a variable that was not yet assigned a length, the variable length is determined by the length of the argument.

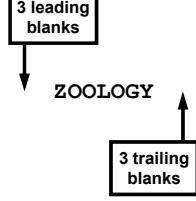

VAR (13 bytes)	Assignment Statement Using the LEFT or RIGHT Function	New Variable (13 bytes)
	<pre>NewVar1 = left(Var);</pre>	
	<pre>NewVar2 = right(Var);</pre>	

20

Q

LEFT and RIGHT Functions

What is the value of the new variable?

VAR (13 bytes)	Assignment Statement Using the LEFT or RIGHT Function	New Variable (13 bytes)
	<pre>NewVar3 = substr(left(Var),1,3);</pre>	

21

Concatenation Operator

The *concatenation operator* (|| - two vertical bars, !! - two broken vertical bars, or !! - two exclamation points) concatenates character values.

```
FullName = First || Middle || Last;
```

- The length of the resulting variable is the sum of the lengths of each variable or constant in the concatenation operation, unless you use a LENGTH statement to specify a different length for the new variable.
- The concatenation operator does not trim leading or trailing blanks. If variables are padded with trailing blanks, use the TRIM function to trim trailing blanks from values before concatenating them.

23

Concatenation Operator

```
data name;
  length Name $ 20 First Middle Last $ 10;
  Name = 'Jones, Mary Ann, Sue';
  First = left(scan(Name,2,','));
  Middle = left(scan(Name,3,','));
  Last = scan(name,1,',');
  FullName = First || Middle || Last;
run;
```

First (10 bytes)	Middle (10 bytes)	Last (10 bytes)
Mary Ann	Sue	Jones

FullName (30 bytes)		
Mary Ann	Sue	Jones

24

2 blanks 7 blanks 5 blanks

TRIM Function

The *TRIM function* removes trailing blanks from character expressions and returns one blank if the expression is missing.

```
FullName = trim(First) || trim(Middle) || Last;
```

- The TRIM function is useful for concatenating because concatenation does not remove trailing blanks.
- If the TRIM function returns a value to a variable that was not yet assigned a length, by default, the variable length is determined by the length of the argument.

25

TRIM Function

```
data name;
length Name $ 20 First Middle Last $ 10;
Name = 'Jones, Mary Ann, Sue';
First = left(scan(Name,2,','));
Middle = left(scan(Name,3,','));
Last = scan(name,1,',');
FullName = trim(First)||trim(Middle)||Last;
run;
```

First (10 bytes)	Middle (10 bytes)	Last (10 bytes)
Mary Ann	Sue	Jones

FullName (30 bytes)
Mary AnnSueJones

 14 bytes

26

Q

TRIM Function

The following program is submitted:

```
data name;
length Name $ 20 First Middle Last $ 10;
Name = 'Jones, Mary Ann, Sue';
First = left(scan(Name,2,','));
Middle = left(scan(Name,3,','));
Last = scan(name,1,',');
Name1=trim(Middle);
Name2=trim(First)||' '||trim(Middle)||' '||Last;
run;
```

What is the byte size of **Name1** and **Name2**?

- A. Name1=3 and Name2=30
- B. Name1=3 and Name2=32
- C. Name1=10 and Name2=30
- D. Name1=10 and Name2=32

27

CAT Functions

The following functions concatenate character strings:

CAT	does not remove leading or trailing blanks. <code>FullName1 = cat(First, Middle, Last);</code>
CATS	removes leading and trailing blanks. <code>FullName2 = cats(First, Middle, Last);</code>
CATT	removes trailing blanks. <code>FullName3 = catt(First, Middle, Last);</code>
CATX	removes leading and trailing blanks and inserts separators. <code>FullName4 = catx(' ', First, Middle, Last);</code>

29

```

data name;
length First Middle Last $ 10;
First = 'Tony';
Middle = ' Albert';
Last = 'Smith';
Name1 = cat(First, Middle, Last);
Name2 = cats(First, Middle, Last);
Name3 = catt(First, Middle, Last);
Name4 = catx(' ', First, Middle, Last);
run;

```

First (10 bytes)	Middle (10 bytes)	Last (10 bytes)
Tony	Albert	Smith

New Variables (200 bytes)

Name1	Tony	Albert	Smith	CAT does not remove blanks.
Name2	Tony	Albert	Smith	CATS removes leading and trailing blanks.
Name3	Tony	Albert	Smith	CATT removes trailing blanks.
Name4	Tony	Albert	Smith	CATX is CATS plus adds separators.

30

CAT Functions

The following program is submitted:

```

data location;
length City State $ 15 CityState $ 30;
City='Princeton';
State='New Jersey';
<insert statement here>
run;

```

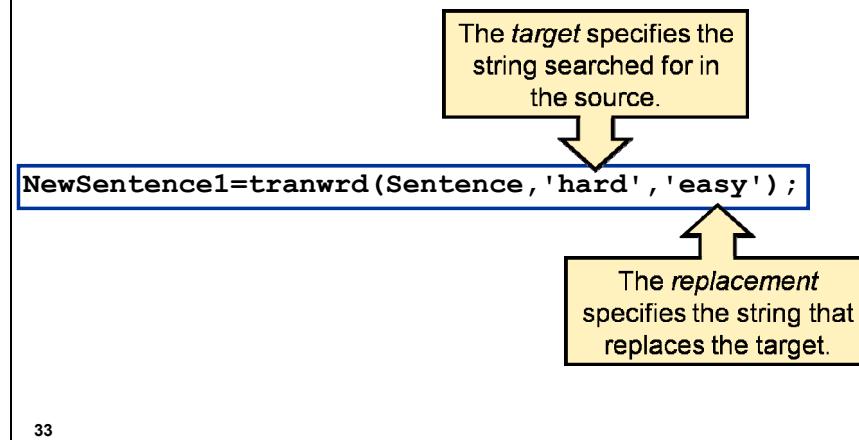

Which statement will give the **CityState** variable a value of Princeton, New Jersey?

- A. **CityState = cats(City, State);**
- B. **CityState = cats(' ', City, State);**
- C. **CityState = catx(' ', City, State);**
- D. **CityState = catx(' ', ' ', City, State);**

31

TRANWRD Function

The *TRANWRD function* replaces or removes all occurrences of a word in a character string.

33

TRANWRD Function

If the TRANWRD function returns a value to a variable that was not yet assigned a length, by default, the variable is assigned a length of 200.

SENTENCE (31 bytes)	
Functions are very hard to use.	
Assignment Statement Using the TRANWRD Function	New Variable (200 bytes)
<code>NewSentence1 = tranwrd(Sentence, 'hard', 'easy');</code>	Functions are very easy to use.
<code>NewSentence2 = tranwrd(Sentence, 'hard', 'difficult');</code>	Functions are very difficult to use.

34

TRANWRD Function

The following program is submitted:

```
data function;
  Sentence='Functions are very hard to use.';
  NewSentence3=tranwrd(Sentence,'HARD','FUN');
run;
```

What is the result of **NewSentence3**?

- A. Functions are very hard to use.
- B. Functions are very HARD to use.
- C. Functions are very fun to use.
- D. Functions are very FUN to use.

35

INDEX Function

The *INDEX* function searches a character expression for a string of characters.

```
num = index(string,substring);
```

- The INDEX function searches the string, from left to right, for the first occurrence of the substring, and returns the position in the string of the substring's first character.
- If the substring is not found in the string, the INDEX function returns a value of 0.
- If there are multiple occurrences of the substring, the INDEX function returns only the position of the first occurrence.

37

INDEX Function

```
num = index(string, substring);
```

STRING character 37 bytes	SUBSTRING character 4 bytes	NUM numeric 8 bytes
How much WOOD would a woodchuck chuck	WOOD	10
	wood	23

10 23

38

INDEX Function

The following program is submitted:

```
data tonguetwister;
  string='How much WOOD would a woodchuck chuck';
  num=index(string,'wood ');
run;
```

What is the value of **num**?

- A. 0
- B. 10
- C. 14
- D. 23

39

INDEX Function

The following program is submitted:

```
data tonguetwister;
  string='How much WOOD would a woodchuck chuck';
  num=index(string,' wo');
run;
```

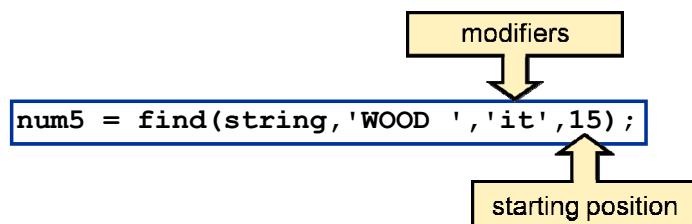

What is the value of **num**?

- A. 0
- B. 10
- C. 14
- D. 23

41

FIND Function

The *FIND function* and the INDEX function both search for substrings of characters in a character string. However, the FIND function can have modifiers and specify a starting position.

43

FIND Function

A *modifier* is a character constant, variable, or expression that specifies one or more modifiers. The following modifiers can be in uppercase or lowercase:

- i - ignores character case during the search.
- t - trims trailing blanks from string and substring.

44

continued...

FIND Function

The *starting position* is an integer that specifies the position at which the search should start and the direction of the search.

- Greater than 0 - starts the search at the starting position, and the direction of the search is to the right. If the starting position is greater than the length of the string, the FIND function returns a value of 0.
- Less than 0 - starts the search at the starting position, and the direction of the search is to the left. If the starting position is greater than the length of the string, the search starts at the end of the string.

45

FIND Function

```
num5 = find(string, 'WOOD ', 'it', 15);
```

ignore case and
trim trailing blanks

start at position
15 and search
to the right

string character 37 bytes	num5 numeric 8 bytes
How much WOOD would a woodchuck chuck	23

15 → 23

46

Refer to Exercise 2 for Chapter 5 in Appendix A.

Case Functions

The *LOWCASE function* converts all letters in an argument to lowercase.

```
name1 = lowercase(name);
```

The *UPCASE function* converts all letters in an argument to uppercase.

```
name2 = upcase(name);
```

49

Case Functions

The *PROPCASE function* converts all words in an argument to proper case.

```
name3 = propcase(name);
```

- The PROPCASE function first converts all letters to lowercase letters and then converts the first character of words to uppercase.
- The first character of a word is the first letter of a string or any letter preceded by a default list of delimiters.
Default Delimiter List: blank / - (. tab
- Delimiters can be specified as a second argument, instead of using the default list.

```
name4 = propcase(name, ' ');
```

50

Case Functions

If the case functions return a value to a variable that was not yet assigned a length, by default, the variable length is determined by the length of the first argument.

name (16 bytes)	Assignment Statement Using Case Functions	New Variable (16 bytes)
Jane SMITH-JONES	name1 = lowercase(name);	jane smith-jones
	name2 = upcase(name);	JANE SMITH-JONES
	name3 = propcase(name);	Jane Smith-Jones
	name4 = propcase(name, ' ');	Jane Smith-jones

51

Case Functions

The following program is submitted:

```
data example;
  Var='r&d, u.s. division (not puerto rico)';
  NewVar=propcase(Var);
run;
```

The following is the desired value of **NewVar**:

R&D, U.S. Division (Not Puerto Rico)

Yes or No: Does the program create the desired value of **NewVar**?

52

State Function

State

STNAMEL

The *STNAMEL* function converts a two-character state postal code to the corresponding state name in mixed case.

If the function returns a value to a variable that was not yet assigned a length, the variable is assigned a length of 20.

state (2 bytes)	Assignment Statement using STNAMEL Function	newstate (20 bytes)
IN		Indiana
GA		Georgia
MO		Missouri
SC	newstate = stnamel(state);	South Carolina

54

STNAMEL Function

The STNAMEL function ignores trailing blanks.

The STNAMEL function generates an error if the expression contains leading blanks.

```
97  data test;
98    state=' IL';
99    newstate=stnameL(state);
100   run;

NOTE: Invalid argument to function STNAMEL at line 99 column 12.
state=IL newstate= _ERROR_=1 _N_=1
NOTE: The data set WORK.TEST has 1 observations and 2 variables.
NOTE: DATA statement used (Total process time):
      real time          0.00 seconds
      cpu time          0.01 seconds
```

55

Date Functions

Date	
WEEKDAY	YEAR
DAY	TODAY
MONTH	MDY
QTR	YRDIF

56

Date Functions

The SAS date value for Wednesday, June 13, 1962, is 894.

```
data birthday;
  BirthDate=894;
  BirthWeekDay=weekday(BirthDate);
  BirthDay=day(BirthDate);
  BirthMonth=month(BirthDate);
  BirthQtr=qtr(BirthDate);
  BirthYear=year(BirthDate);
  output;
run;
```

What is the value of **BirthQtr**?

Birth Date	Birth WeekDay	Birth Day	Birth Month	Birth Qtr	Birth Year
894	4	13	6	1	1962

57

Date Functions

- The *WEEKDAY function* returns the day of the week (1=Sunday, ... 7=Saturday) from a SAS date value.
- The *DAY function* returns the day of the month (1-31) from a SAS date value.
- The *MONTH function* returns the month (1-12) from a SAS date value.
- The *QTR function* returns the quarter of the year (1-4) from a SAS date value.
- The *YEAR function* returns the four-digit year from a SAS date value.

59

Q

Date Functions

The following program is submitted:

```
data birthday;
  BirthDate='13JUN1962'd;
  BirthWeekDay=weekday(BirthDate);
  output;
run;
```

Which of the following statements is **true**?

- A. `BirthDate` and `BirthWeekDay` are both character.
- B. `BirthDate` and `BirthWeekDay` are both numeric.
- C. `BirthDate` is character and `BirthWeekDay` is numeric.
- D. `BirthDate` is numeric and `BirthWeekDay` is character.

60

TODAY Function

The *TODAY* function returns the current date as a SAS date value.

- A SAS date value is the number of days since January 1, 1960.

If today were December 15, 2007:

Current (Numeric 8 bytes)	
Current = today();	17515

62

MDY Function

The *MDY function* returns a SAS date value from month (integer 1 through 12), day (integer 1 through 31), and year (two-digit integer or four-digit integer) values.

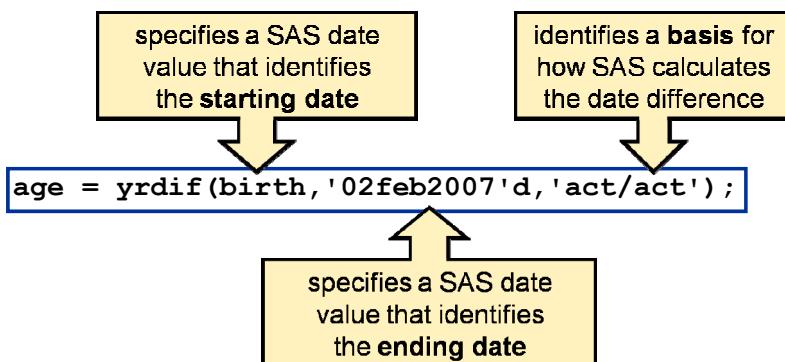

Date (Numeric 8 bytes)	
Date = mdy(12,15,2007) ;	17515
Date = mdy(m,d,y) ;	8121

m	d	y	Date
3	27	1982	8121

63

YRDIF Function

The *YRDIF function* returns the difference in years between two dates.

64

YRDIF Function

Possible BASIS values:

'30/360'

specifies a 30-day month and a 360-day year in calculating the number of years.

'ACT/ACT'

uses the actual number of days between dates in calculating the number of years (the number of days that fall in 365-day years divided by 365 plus the number of days that fall in 366-day years divided by 366).

'ACT/360'

uses the actual number of days between dates in calculating the number of years (the number of days divided by 360).

'ACT/365'

uses the actual number of days between dates in calculating the number of years (the number of days divided by 365).

65

YRDIF Function

```
data age;
  set birthday;
  age = yrdif(birth,'02feb2007'd,'act/act');
run;
```

	birth	age
1	3985	36.178082192
2	3673	37.032876712

3985 is November 29, 1970.

3673 is January 21, 1970.

66

YRDIF Function

Given the following assignment statement:

```
age=yrdif('05MAY1999'd,'10NOV1999'd,'act/act');
```

What is an approximate value of **age**?

67

Truncation Functions

Truncation
CEIL
FLOOR
INT
ROUND

69

Refer to Exercise 3 for Chapter 5 in Appendix A.

CEIL and FLOOR Functions

The *CEIL function* returns the smallest integer that is **greater** than or equal to the argument.

The *FLOOR function* returns the largest integer that is **less** than or equal to the argument.

num	ceil (num)	floor (num)
2.75	3	2
-2.75	-2	-3
23.1234	24	23
-23.1234	-23	-24

If the argument is within 1E-12 of an integer, the function returns that integer.

72

CEIL and FLOOR Functions

Q

The following program is submitted:

```
data trunc;
  num=29;  A=ceil (num) ;  B=floor (num) ;
  output;
run;
```

What is the value of **A** and **B** in the final data set?

- A. **A**=29 and **B**=29
- B. **A**=30 and **B**=28
- C. **A**=30 and **B**=29
- D. **A**=29 and **B**=28

73

INT Function

The *INT function* returns the integer value.

num	int (num)
2.75	2
-2.75	-2
23.1234	23
-23.1234	-23

If the argument is within 1E-12 of an integer, the INT function returns that integer.

75

Q

INT Function

Yes or No: Are both of the following statements **true**?

- The INT function has the same result as the FLOOR function if the value of the argument is positive.
- The INT function has the same result as the CEIL function if the value of the argument is negative.

num	ceil (num)	floor (num)	int (num)
2.75	3	2	2
-2.75	-2	-3	-2
23.1234	24	23	23
-23.1234	-23	-24	-23

76

ROUND Function

The *ROUND function* rounds the first argument to the nearest integer when the second argument is omitted.

num	round(num)
2.75	3
-2.75	-3
23.1234	23
-23.1234	-23

78

ROUND Function

The ROUND function rounds the first argument to the nearest multiple of the second argument.

```
data rounding;
  d1 = round(1234.56789, 100)
  d2 = round(1234.56789, 10);
  d3 = round(1234.56789, 1);
  d4 = round(1234.56789, .1);
  d5 = round(1234.56789, .01);
  d6 = round(1234.56789, .001);
run;
```

d1	d2	d3	d4	d5	d6
1200	1230	1235	1234.6	1234.57	1234.568

79

ROUND Function

The following program is submitted:

```
data round;
  num=986.151;
  C=round(num,100);  D=round(num,.01);
  output;
run;
```

What is the value of **C** and **D** in the final data set?

- A. **C**=900 and **D**=986.2
- B. **C**=1000 and **D**=986.2
- C. **C**=900 and **D**=986.15
- D. **C**=1000 and **D**=986.15

80

Descriptive Statistics Functions

Descriptive Statistics
MAX
MEAN
MIN
SUM

- The *MAX function* returns the largest value.
- The *MEAN function* returns the arithmetic mean (average).
- The *MIN function* returns the smallest value.
- The *SUM function* returns the sum of the nonmissing arguments.

82

Descriptive Statistics Functions

```
data math;
  var1=2;
  var2=6;
  var3=.;
  var4=4;
  maximum = max(var1,var2,var3,var4);
  average = mean(var1,var2,var3,var4);
  minimum = min(var1,var2,var3,var4);
  total = sum(var1,var2,var3,var4);
run;
```

maximum	average	minimum	total
6	4	2	12

83

Descriptive Statistics Functions

The argument list can consist of a variable list, which is preceded by OF.

```
data math;
  var1=2;
  var2=6;
  var3=.;
  var4=4;
  maximum = max(of var1-var4);
  average = mean(of var1-var4);
  minimum = min(of var1-var4);
  total = sum(of var1-var4);
run;
```

maximum	average	minimum	total
6	4	2	12

84

SAS Variable Lists		
Numbered range lists	x1-xn	specifies all variables from x1 to xn inclusive. You can begin with any number and end with any number as long as you do not violate the rules for user-supplied variable names and the numbers are consecutive.
Name range lists	x--a	specifies all variables ordered as they are ordered in the program data vector, from x to a inclusive.
	x-numeric-a	specifies all numeric variables from x to a inclusive.
	x-character-a	specifies all character variables from x to a inclusive.
Name prefix lists	REV:	specifies all the variables that begin with REV , such as REVJAN , REVFEB , and REVMAR .
Special SAS name lists	_ALL_	specifies all variables that are already defined in the current DATA step.
	NUMERIC	specifies all numeric variables that are already defined in the current DATA step.
	CHARACTER	specifies all character variables that are already defined in the current DATA step.

Descriptive Statistics Functions

The following program is submitted:

```
data math;
  var1=30;
  var2=15;
  var3=10;
  total = sum(var1-var3);
run;
```

What is the value of **total**?

- A. 0
- B. 20
- C. 40
- D. 55

5.2 Converting Character and Numeric Data

Converting Character and Numeric Data

Data can be converted with the following two methods:

- automatic conversion
- explicit conversion with a SAS function

Special	
INPUT	PUT
character-to-numeric	numeric-to-character

88

Automatic Character-to-Numeric Conversion

Automatic character-to-numeric conversion happens when a character value is used in a numeric context.

For example:

- assignment to a numeric variable
`num=char;`
- an arithmetic operation
`num2=num1+char;`
- logical comparison with a numeric value
`if num>char;`
- a function that takes numeric arguments
`num2=mean (num1, char);`

89

Automatic Character-to-Numeric Conversion

Automatic character-to-numeric conversion

- uses the W. informat
- produces a numeric missing if the character value does not conform to the W. informat
- writes a message to the SAS log stating that the conversion occurred.

```
819 data numeric;
820   num1=5;
821   char='6';
822   num2=num1+char;
823 run;
```

NOTE: Character values have been converted to numeric values at the places given by: (Line):(Column).
822:13

NOTE: The data set WORK.NUMERIC has 1 observations and 3 variables.

90

Automatic Numeric-to-Character Conversion

Automatic numeric-to-character conversion happens when a numeric value is used in a character context.

For example:

- assignment to a character variable
`char=num;`
- a concatenation operation
`char2=char1||num;`
- a function that takes character arguments
`char=substr(num,3,1);`

91

Automatic Numeric-to-Character Conversion

Automatic numeric-to-character conversion

- uses the BEST12. format
- right-aligns the resulting character value
- writes a message to the SAS log stating that the conversion occurred.

```
828 data character;
829   num=1234567;
830   char=substr(num,3,1);
831 run;
```

NOTE: Numeric values have been converted to character
values at the places given by: (Line):(Column).
830:15

NOTE: The data set WORK.CHARACTER has 1 observations and 2 variables.

92

Refer to Exercise 4 for Chapter 5 in Appendix A.

Explicit Conversion Using SAS Functions

Explicit conversion using a SAS function

- produces desirable results
- does **not** write a message to the SAS log stating that the conversion occurred.

Special

INPUT	PUT
character-to-numeric	numeric-to-character

96

Explicit Conversion Using SAS Functions

The INPUT function converts a character value to a numeric value.

- The second argument is a numeric informat.
- If the INPUT function returns a value to a variable that was not yet assigned a length, by default, the variable length is 8 bytes.

The PUT function converts a numeric value to a character value.

- The second argument is a numeric format.
- If the PUT function returns a value to a variable that was not yet assigned a length, by default, the variable length is determined by the width of the format.

97

INPUT Function

Value of Character Variable		Value of Numeric Variable (8 bytes)
162400	input('162400',6.)	162400
\$162,400	input('\$162,400',comma8.)	162400
49275.937	input('49275.937',9.)	49275.937
+24	input('+24',3.)	24
-73.5	input('-73.5',5.)	-73.5
01234	input('01234',5.)	1234
52E3	input('52E3',4.)	52000
01/01/1960	input('01/01/1960',mmddyy10.)	0

98

PUT Function

Value of Numeric Variable (8 bytes)		Value of Character Variable
162400	<code>put(162400,dollar8.);</code>	\$162,400
49275.937	<code>put(49275.937,commal0.3);</code>	49,275.937
-73.5	<code>put(-73.5,5.1);</code>	-73.5
52E3	<code>put(52E3,5.);</code>	52000
0	<code>put(0,date9.);</code>	01JAN1960

99

Data Set Personnel:

	Hired	First	Last	SSN
1	27MAR2003	Samatha	Jones	444444444
2	01SEP2006	Timothy	Peters	999999999

Hired is character.

SSN is numeric.

The following program is submitted:

```
data NewPersonnel;
  set Personnel;
  NewHired=input(Hired,date9.);
  TempSSN=put(SSN,9.);
  NewSSN=catx('-',substr(TempSSN,1,3),
              substr(TempSSN,4,2),
              substr(TempSSN,6));
run;
```

Data Set NewPersonnel:

	Hired	First	Last	SSN	NewHired	TempSSN	NewSSN
1	27MAR2003	Samatha	Jones	444444444	15791	444444444	444-44-4444
2	01SEP2006	Timothy	Peters	999999999	17045	999999999	999-99-9999

The SSNw. format could be used to display the numeric SSN with dashes.

100

INPUT and PUT Functions

Data Set **Personnel**:

	Hired	First	Last	SSN
1	27MAR2003	Samatha	Jones	444444444
2	01SEP2006	Timothy	Peters	999999999

Q

Hired is character.

SSN is numeric.

The following program is submitted:

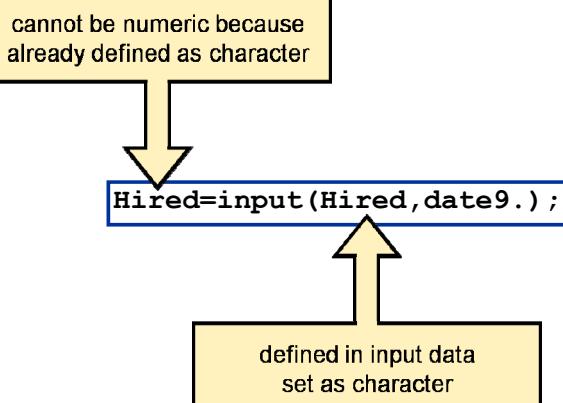

```
data NewPersonnel;
  set Personnel;
  Hired=input(Hired,date9.);
  SSN=put(SSN,9.);
run;
```

Yes or No: Does this modified program create a numeric **Hired** and a character **SSN**?

101

INPUT and PUT Functions

After a variable type is established, it cannot be changed.

103

INPUT and PUT Functions

Solution:

```
data NewPersonnel;
  set Personnel
    → (rename=(Hired=TempH SSN=TempS));
  Hired=input(TempH,date9.);
  SSN=put(TempS,9.);
  → drop TempH TempS;
run;
```

- The RENAME= data set option changes the names of the original variables with unwanted data types.
- The DROP statement excludes the original variables with unwanted data types from the output SAS data set.

5.3 Processing Data with DO Loops

DO Loops

The *DO loop* executes statements between DO and END repetitively based on the value of an index variable.

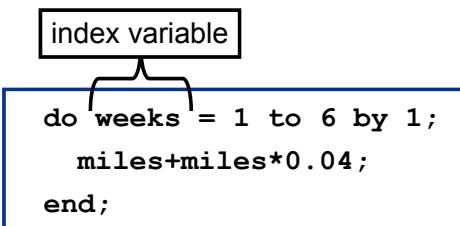

```
data training;
  miles=30;
  do weeks = 1 to 6 by 1;
    miles+miles*0.04;
  end;
run;
```

- Sally ran 30 miles per week.
- She plans to increase her mileage by 4% each week for six weeks.

106

Index Variable

The *index variable* names a variable whose value governs execution of the DO group.

- The index variable argument is required.
- Unless you specify to drop it, the index variable is included in the data set that is being created.

107

Specification

The *specification* denotes an expression or a series of expressions.

```
specification
  do weeks = 1 to 6 by 1;
    miles+miles*0.04;
  end;
```

Possible specifications:

- *start TO stop BY increment*
- *start1, start2, ...*
- **WHILE**(*expression*)
- **UNTIL**(*expression*)

108

Specification

```
start  stop  increment
      ↓    ↓    ↓
do weeks = 1 to 6 by 1;
  miles+miles*0.04;
end;
```

- *start* specifies the initial value of the index variable.
- *stop* is an optional value that specifies the ending value of the index variable.
- *increment* is an optional value that specifies a positive or negative number to control the incrementing of the index variable.

If no increment is specified, the index variable is increased by 1.

109

Specification

Q

Which of the following is **not** a valid DO statement?

- A. `do 2 to 10 by 2;`
- B. `do year=2006 to 2000 by -2;`
- C. `do count=1 to num2+num3 by num4;`
- D. `do date='15JUN2007'd to '31DEC2007'd;`

110

DO Loop Output

Q

The following program is submitted:

```
data training;
  miles=30;
  do weeks = 1 to 6;
    miles+miles*0.04;
  end;
run;
proc print data=training noobs;
run;
```

What is the result?

A.

miles	weeks
31.2000	1
32.4480	2
33.7459	3
35.0958	4
36.4996	5
37.9596	6

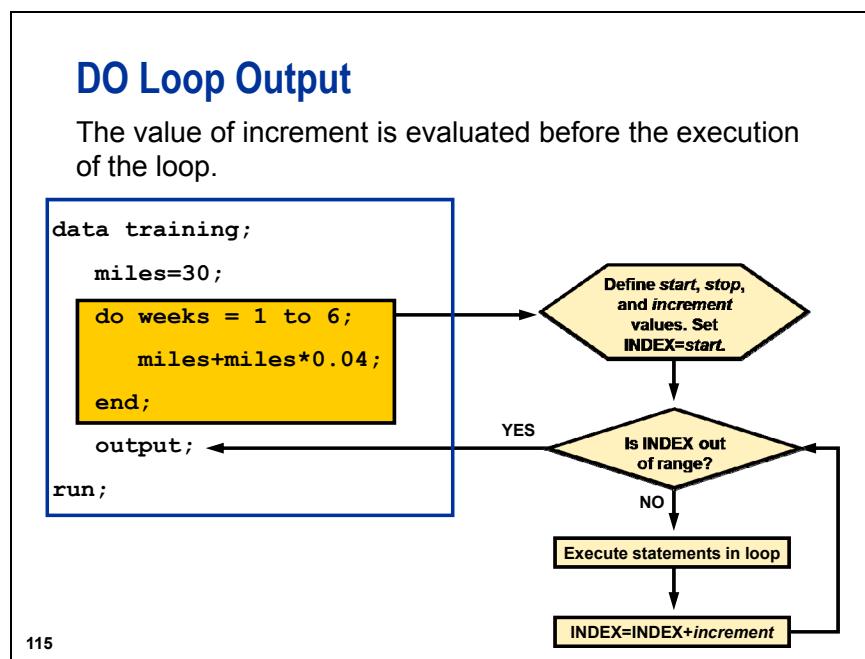

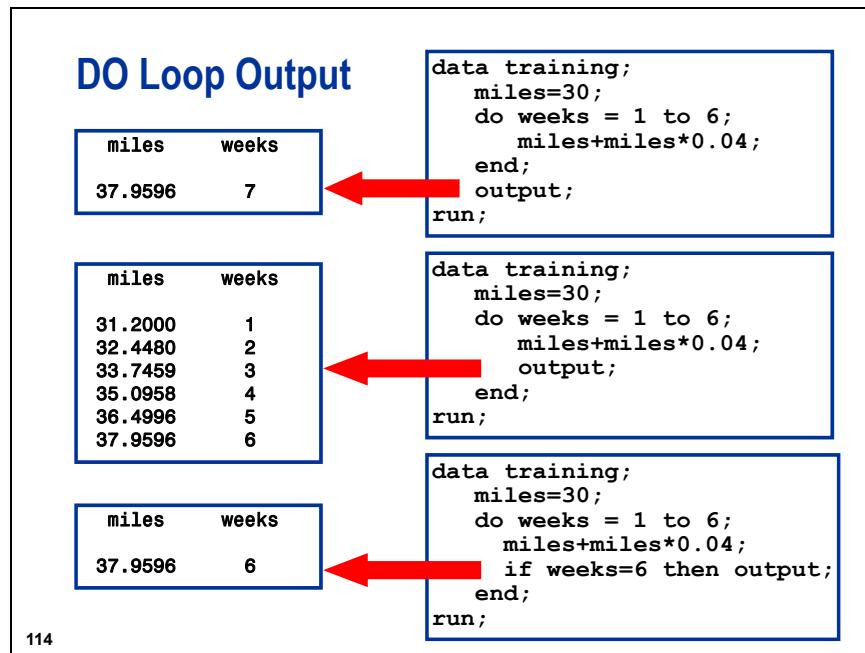

B.

miles	weeks
37.9596	6

C.

miles	weeks
37.9596	7

112

DO Loop with SET Statement

```
data training;
  set runners;
  do weeks=1 to 6;
    miles+miles*pct;
    output;
  end;
run;
```

VIEWTABLE: Work.Runners

	name	miles	pct
1	Jill	24	0.05
2	Ray	28	0.04
3	Mark	30	0.05

1. How many times does SAS loop through the DATA step?
2. How many times does SAS loop through the DO loop per each DATA step iteration?
3. How many observations are created?

116

DO Loop with SET Statement

Three observations are in the data set **work.runners**.

118

Q

DO Loop with INFILE/INPUT Statements

Yes or No: Can a DO loop be in a DATA step that is reading in a raw data file?

```
data training;
  infile 'raw-data-file';
  input name $ miles pct;
  do weeks=1 to 6;
    miles+miles*pct;
    output;
  end;
run;
```

119

Nested DO Loops

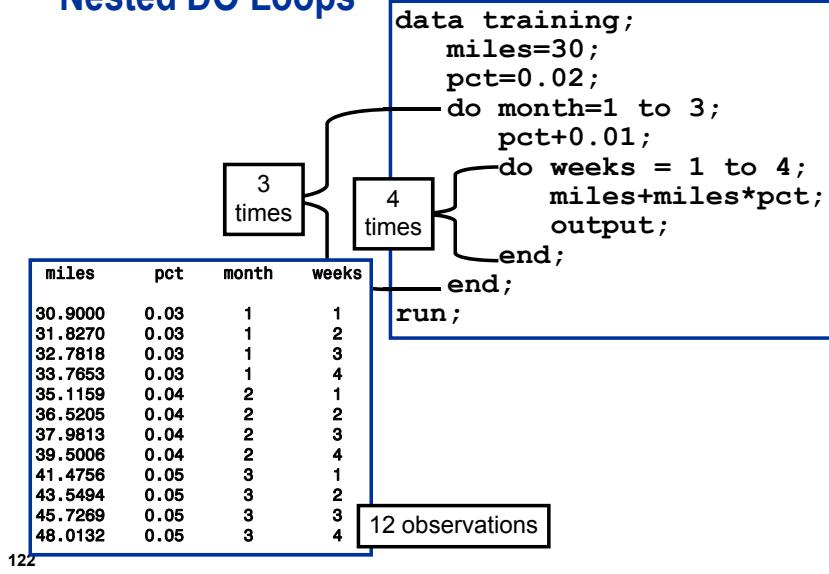

DO loops can be nested.

miles	pct	month	weeks	
30.9000	0.03	1	1	3% weekly increase for month 1
31.8270	0.03	1	2	
32.7818	0.03	1	3	
33.7653	0.03	1	4	
35.1159	0.04	2	1	4% weekly increase for month 2
36.5205	0.04	2	2	
37.9813	0.04	2	3	
39.5006	0.04	2	4	
41.4756	0.05	3	1	5% weekly increase for month 3
43.5494	0.05	3	2	
45.7269	0.05	3	3	
48.0132	0.05	3	4	

- Sally runs 30 miles per week.
- She plans to increase her mileage weekly for three months.

121

Nested DO Loops

Nested DO Loops

Q

The following program is submitted with no OUTPUT statement:

```

data training;
  miles=30;
  pct=0.02;
  do month=1 to 3;
    pct+0.01;
    do weeks = 1 to 4;
      miles+miles*pct;
    end;
  end;
run;
  
```

How many observations are created?

- A. 0 B. 1 C. 3 D. 12

123

Additional Specifications

The specification in the DO statement can be a series of items separated by commas.

- The items can be either all numeric or all character constants, or might be variables.
- Character constants must be enclosed in quotation marks.
- The DO group is executed once for each value in the list.

Examples:

- `do month = 'JAN', 'FEB', 'MAR' ;`
- `do count = 2,3,5,7,11,13,17;`
- `do i = var1, var2, var3;`
- `do date = '01JAN2007'd, '25APR2007'd;`

125

Additional Specifications

```
data training;
  miles=30;
  do date=today()+30, today()+100;
    miles+miles*0.10;
    output;
  end;
run;
```

miles	date
33.0	27MAY2007
36.3	05AUG2007

- Sally runs 30 miles per week.
- Thirty days from now she plans to increase her mileage by 10%.
- One hundred days from now she plans to increase her mileage again by 10%.

126

Conditional Specifications

The DO statement can execute statements repetitively while a condition is true or until a condition is true.

DO WHILE(expression)

- executes while a condition is true
- is evaluated at the **top** of the loop
- does not execute if the expression is false the first time that it is evaluated.

DO UNTIL(expression)

- executes until a condition is true
- is evaluated at the **bottom** of the loop
- is executed at least once.

127

Conditional Specifications

```
data training;
  miles=30;
  → do while(miles<=50);
    week+1;
    miles+miles*0.04;
    output;
  end;
run;
```

```
data training;
  miles=30;
  → do until(miles>50);
    week+1;
    miles+miles*0.04;
    output;
  end;
run;
```

	miles	week
1	31.2	1
2	32.45	2
3	33.75	3
4	35.1	4
5	36.5	5
6	37.96	6
7	39.48	7
8	41.06	8
9	42.7	9
10	44.41	10
11	46.18	11
12	48.03	12
13	49.95	13
14	51.95	14

Sally plans to increase her mileage by 4% each week until she runs 50+ miles per week.

128

Q

Conditional Specifications

Yes or No: Will the DO loop in the following program execute?

```
data training;
  miles=45;
  do until(miles>40);
    week+1;
    miles+miles*0.04;
    output;
  end;
run;
```

129

Combined Specifications

A WHILE(*expression*) or UNTIL(*expression*) specification can be combined with the start-to-stop-by-increment specification.

```
data training;
  miles=30;
  do weeks=1 to 30 until(miles>50);
    miles+miles*0.02;
    output;
  end;
run;
```

Sally plans to increase her mileage by 2% each week until she runs 50+ miles per week **or** until she reaches 30 weeks.

131

In a DO UNTIL loop, the condition is checked **before** the index variable is incremented.

In a DO WHILE loop, the condition is checked **after** the index variable is incremented.

Combined Specifications

The following program is submitted:

```
data training;
  miles=30;
  do weeks=1 to 30 until(miles>50);
    miles+miles*0.02;
    output;
  end;
run;
```

The **training** data set has 26 observations with the last observation resembling the following:

miles	weeks
50.202543431	26

What ended the DO loop?

- A. **weeks=1 to 30** B. **until(miles>50)**

5.4 Processing Data with Arrays

Arrays

An **array** is a temporary grouping of SAS variables that are arranged in a particular order and identified by an array name.

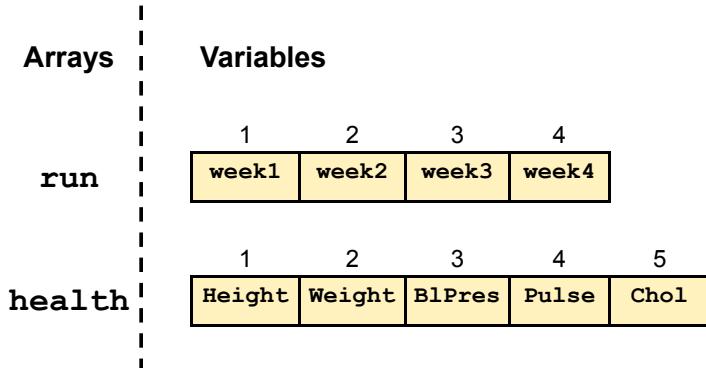

- Arrays exist only for the duration of the current DATA step.
- Arrays are referenced by the array name and a subscript.
- The array name is not a variable.

An array is only a convenient way of temporarily identifying a group of variables. Arrays are often referenced in DO loops because more than one element in an array must be processed.

136

Arrays

Examples:

137

Defining an Array

An ARRAY statement defines elements of an array.

```
array run{4} week1-week4;
```

```
array health{5} Height Weight BlPres Pulse Chol;
```

array name

number of elements
(variables) in the array

list of variables
in the array

- The number of elements must be enclosed in parentheses (), braces {}, or brackets [].
- Variables defined in a given array must be all character or all numeric.

138

Referencing an Array

To reference an array that was previously defined in the same DATA step, use an array reference.

139

Defining and Referencing an Array

VIEWTABLE: Work.Weekly

	name	week1	week2	week3	week4
1	Jack	25	32	48	33
2	Susan	10	12	10	10

```
data Increase;
  set Weekly;
  array run{4} week1 - week4;
  do week = 1 to 4;
    run{week} = run{week}*1.10;
  end;
  drop week;
run;
```

VIEWTABLE: Work.Increase

	name	week1	week2	week3	week4
1	Jack	27.5	35.2	52.8	36.3
2	Susan	11	13.2	11	11

140

Q

Defining and Referencing an Array

```
data Stats2(drop=i);
  set Stats;
  count=0;
  array _____ height weight blpres pulse chol;
  do i = 1 to 5;
    if health{i} = 'AboveAve' then count+1;
  end;
run;
```

VIEWTABLE: Work.Stats2

	name	height	weight	blpres	pulse	chol	count
1	Jana	Ave	Ave	Ave	Ave	Ave	0
2	Tyler	Ave	AboveAve	AboveAve	Ave	AboveAve	3
3	William	Ave	Ave	Ave	Ave	AboveAve	1

Based on the program and the results of the final data set, what should be in the blank space?

- A. `i{5}`
- B. `count{5}`
- C. `height{5}`
- D. `health{5}`

141

Refer to Exercise 5 for Chapter 5 in Appendix A.

Creating Numeric Variables with an Array

An array can be based on existing variables or new variables.

```
data WeeklyDiff(drop=week);
  set Weekly;
  array run{4} week1 - week4; ← array based on
  array diff{3} diff21 diff32 diff43; ← existing variables
  do week = 1 to 3;
    diff{week} = run{week+1}-run{week}; ← array based on
  end; ← new variables
run;
```

	name	week1	week2	week3	week4	diff21	diff32	diff43
1	Jack	25	32	48	33	7	16	-15
2	Susan	10	12	10	10	2	-2	0

145

Creating Numeric Variables with an Array

SAS creates variable names by concatenating the array name and the numbers 1, 2, 3, . . . n.

```
data WeeklyPct(drop=week);
  set Weekly;
  total=sum(of week1-week4);
  array run{4} week1 - week4; ← array based on
  array pctwk{4}; ← existing variables
  do week = 1 to 4;
    pctwk{week} = run{week}/total; ← array based on
  end; ← new variables
  format pctwk1-pctwk4 percent6.;
run;
```

	name	week1	week2	week3	week4	total	pctwk1	pctwk2	pctwk3	pctwk4
1	Jack	25	32	48	33	138	18%	23%	35%	24%
2	Susan	10	12	10	10	42	24%	29%	24%	24%

146

Creating Character Variables with an Array

If an array is based on new character variables, the elements must be defined as character with a byte size.

```
data newnames(drop=i);
  set names;
  array first{3};←
  array newfirst{3} $ 7;←
  do i=1 to 3;
    newfirst{i}=propcase(first{i});
  end;
run;
```

	first1	first2	first3	newfirst1	newfirst2	newfirst3
1	janet	russell	cheryl	Janet	Russell	Cheryl

147

Creating Character Variables with an Array

Q

```
data newnames(drop=i);
  set names;
  array first{3};
  array newfirst{3} $ ;
  do i=1 to 3;
    newfirst{i}=propcase(first{i});
  end;
run;
```

What is the byte size of **newfirst1-newfirst3** if a byte size is not specified in the ARRAY statement?

- A. 0
- B. 7 (the byte size of **first1-first3**)
- C. 8
- D. 18

148

Initial Values

Initial values can be specified for the corresponding elements in the array.

```
data score(drop=x);
  infile 'raw-data-file';
  input name $ q1 $ q2 $ q3 $ q4 $ q5 $;
  array answer{5} q1-q5;
  array correct{5} $ 1 ('A', 'B', 'A', 'D', 'C');
  score=0;
  do x=1 to 5;
    if answer{x}=correct{x} initial values
      then score+1;
  end;
run;
```

	name	q1	q2	q3	q4	q5	correct1	correct2	correct3	correct4	correct5	score
1	monica	A	C	B	D	C	A	B	A	D	C	3
2	ted	A	B	A	D	C	A	B	A	D	C	5
3	kelly	A	C	C	A	C	A	B	A	D	C	2

TEMPORARY Option

The _TEMPORARY_ option is used to create a list of temporary data elements.

```
data score(drop=x);
  infile 'raw-data-file';
  input name $ q1 $ q2 $ q3 $ q4 $ q5 $;
  array answer{5} q1-q5;
  array correct{5} $ 1 _temporary_
    ('A', 'B', 'A', 'D', 'C');
  score=0;
  do x=1 to 5;
    if answer{x}=correct{x}
      then score+1;
  end;
run;
```

	name	q1	q2	q3	q4	q5	score
1	monica	A	C	B	D	C	3
2	ted	A	B	A	D	C	5
3	kelly	A	C	C	A	C	2

151

Q

TEMPORARY Option

Which of the following statements is valid?

- A. `array revenue{3} _temporary_
rev1-rev3 (12,15,22);`
- B. `array revenue{3} $ rev1-rev3
temporary ('12','15','22');`
- C. `array revenue{3} _temporary_ (12 15 22);`
- D. `array revenue{3} _temporary_ 8 (12 15 22);`

Chapter 6 Generating Reports

6.1	Creating Detail Reports with the PRINT Procedure.....	6-3
6.2	Creating Formats with the FORMAT Procedure	6-22
6.3	Creating Frequency Tables with the FREQ Procedure	6-29
6.4	Creating Summary Reports with the MEANS Procedure.....	6-34
6.5	Directing Reports to External Files with ODS.....	6-39
6.6	Answers to Questions.....	6-45

6.1 Creating Detail Reports with the PRINT Procedure

The PRINT Procedure

The *PRINT* procedure creates a report of the variables and observations in a SAS data set. You can create a variety of reports ranging from a simple listing to a highly customized report that groups the data and calculates totals and subtotals for numeric variables.

Partial Output

Boot and Sandal Report			
Region=Asia			
Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00
Region		\$206,735.00	\$70,916.00
Created by Tony Smith Chicago, IL			

4

The PRINT Procedure

Which **two** of the following items **cannot** be accomplished with the PRINT procedure?

1. produce detail reports
2. produce summary reports
3. sort data values by one or more variables
4. produce column totals for numeric variables
5. replace variable values with formatted values
6. replace variable names with descriptive labels
7. choose only observations that meet a condition
8. select specific variables and control the order in which the variables appear

5

Example of the PRINT Procedure

```
options nodate nonumber ps=30 ls=64;  
proc print data=sashelp.shoes noobs split='*';  
  var subsidiary product inventory sales;  
  where product='Boot' or product='Sandal';  
  sum inventory sales;  
  by region;  
  pageby region;  
  label inventory='Total*Inventory'  
    sales='Total*Sales';  
  format inventory sales dollar14.2;  
  title 'Boot and Sandal Report';  
  footnote 'Created by Tony Smith';  
  footnote2 'Chicago, IL';  
run;
```

7

Refer to Exercise 1 for Chapter 6 in Appendix A.

NOOBS Option

The *NOOBS* option suppresses the column in the output that identifies each observation by number.

```
proc print data=sashelp.shoes noobs split='*';
```

By default, the PRINT procedure gives an observation column.

10

NOOBS Option

Boot and Sandal Report

Without NOOBS - Region=Asia -----

Obs	Subsidiary	Product	Total Inventory	Total Sales
57	Bangkok	Boot	\$9,576.00	\$1,996.00
59	Bangkok	Sandal	\$15,087.00	\$3,230.00
62	Seoul	Boot	\$160,589.00	\$60,712.00
65	Seoul	Sandal	\$21,483.00	\$4,978.00

Region

Partial Output

Boot and Sandal Report

With NOOBS - Region=Asia -----

Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00

Region

	Total Inventory	Total Sales
Region	\$206,735.00	\$70,916.00

11

VAR Statement

The *VAR* statement selects variables that appear in the report and determines the variables order.

```
var subsidiary product inventory sales;
```

Boot and Sandal Report

Region=Asia -----

Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00

Region

	Total Inventory	Total Sales
Region	\$206,735.00	\$70,916.00

By default, the PRINT procedure displays all variables in the order that the variables are stored in the data set.

12

Q

VAR Statement

The following list report is requested:

Obs	Product	Stores	Returns
1	Boot	12	\$769
2	Men's Casual	4	\$2,284
3	Men's Dress	7	\$2,433
4	Sandal	10	\$1,861

Which VAR statement creates the desired output?

- A. `var product stores returns;`
- B. `var product, stores, returns;`
- C. `var obs product stores returns;`
- D. `var obs, product, stores, returns;`

13

WHERE Statement

The *WHERE statement* subsets the input data set by specifying certain conditions that each observation must meet before it is available for the report.

```
where product='Boot' or product='Sandal';
```

- The WHERE statement does not alter the original data set.
- Typically use only one WHERE statement in a step.
- Character values are case sensitive.

15

WHERE Statement

Which WHERE statement does **not** produce identical results that are identical to those of the other three WHERE statements?

- A. `where product='Boot' or 'Sandal';`
- B. `where product in ('Boot' 'Sandal');`
- C. `where product in ('Boot','Sandal');`
- D. `where product='Boot' or product='Sandal';`

16

WHERE Statement

Operators		Definition
EQ	=	equal to
NE	^= ~= ~=	not equal to
GT	>	greater than
GE	>=	greater than or equal to
LT	<	less than
LE	<=	less than or equal to
IN		equal to one of a list
AND	&	logical and
OR		logical or
NOT	^	logical not
BETWEEN – AND		an inclusive range
CONTAINS	?	a character string

18

WHERE Statement

Examples:

```
where sales > 100000;
where sales eq .;
where name = 'Smith';
where name = ' ';
where sales ge 100000 and name = 'Smith';
where sales ge 100000 or name = 'Smith';
where revenue >= 150 and revenue <= 999;
where revenue between 150 and 999;
where revenue not between 150 and 999;
where month contains 'uary';
where birthdate > '11JUL1968'd;
```

19

WHERE Statement

The following SAS program is submitted:

```
proc print data=sales;
  where month=2;
  where sales>100;
run;
```

Which of the following statements is **true** regarding the program?

- A. Only the first WHERE statement will be used.
- B. Only the second WHERE statement will be used.
- C. Both WHERE statements will be used with a logical OR between the statements.
- D. Both WHERE statements will be used with a logical AND between the statements.

20

SUM Statement

The *SUM statement* totals values of numeric variables.

```
sum inventory sales;
```

Partial Output

Boot and Sandal Report			
----- Region=Asia -----			
Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00
Region		\$206,735.00	\$70,916.00

The SUM statement always gives grand totals and gives subtotals if used with a BY statement.

22

BY Statement

The *BY statement* produces a separate section of the report for each BY group.

```
by region;
```

Partial Output

Boot and Sandal Report			
----- Region=Asia -----			
Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00
Region		\$206,735.00	\$70,916.00

Data must be indexed or sorted to use a BY statement.

23

SUM and BY Statements

Partial Output

Region=Western Europe			
Subsidiary	Product	Total Inventory	Total Sales
Copenhagen	Boot	\$4,657.00	\$1,663.00
Geneva	Boot	\$171,030.00	\$41,341.00
Geneva	Sandal	\$3,529.00	\$736.00
Heidelberg	Boot	\$301,779.00	\$65,610.00
Heidelberg	Sandal	\$4,618.00	\$977.00
Lisbon	Boot	\$341,911.00	\$76,349.00
Lisbon	Sandal	\$24,253.00	\$1,650.00
London	Boot	\$289,527.00	\$54,449.00
London	Sandal	\$11,111.00	\$5,217.00
Madrid	Boot	\$1,027.00	\$1,179.00
Paris	Boot	\$41,506.00	\$19,196.00
Paris	Sandal	\$23,816.00	\$1,520.00
Rome	Boot	\$209,271.00	\$36,244.00
Rome	Sandal	\$4,611.00	\$1,249.00
Region		\$1,432,646.00	\$307,380.00
		=====	=====
		\$12,956,946.00	\$3,218,979.00

24

BY Group

Subtotal

Grand Total

PAGEBY Statement

The *PAGEBY* statement puts each separate section of a BY group on separate pages.

```
pageby region;
```

The PAGEBY statement must name a variable that appears in the BY statement.

25

PAGEBY Statement

Partial Output

Boot and Sandal Report				
Region=Asia				
Subsidiary	Product	Total Inventory	Total Sales	
Bangkok	Boot	\$44,658.00	\$15,062.00	
Bangkok	Sandal	\$13,343.00	\$1,380.00	
Seoul	Boot	\$403,259.00	\$90,972.00	
Seoul	Sandal	\$59,985.00	\$17,492.00	
Region	Boot	\$222,165.00	\$65,248.00	
Region	Sandal	\$71,094.00	\$16,314.00	
Region		\$814,504.00	\$206,468.00	

26

BY and PAGEBY Statements

Q

- Page 1 ----- Region=United States Subsidiary=Chicago -----
- Page 2 ----- Region=United States Subsidiary>New York -----
- Page 3 ----- Region=United States Subsidiary=Seattle -----

Which statements give the desired layout?

- A. **by region;
pageby subsidiary;**
- B. **by region subsidiary;
pageby region;**
- C. **by region subsidiary;
pageby subsidiary;**
- D. **by region subsidiary;
pageby region subsidiary;**

27

LABEL Statement

The *LABEL statement* assigns descriptive labels to variable names.

```
label inventory='Total*Inventory'
      sales='Total*Sales';
```

Partial Output

Boot and Sandal Report				
----- Region=Asia -----				
Obs	Subsidiary	Product	Total Inventory	Total Sales
57	Bangkok	Boot	\$9,576.00	\$1,996.00
59	Bangkok	Sandal	\$15,087.00	\$3,230.00
62	Seoul	Boot	\$160,589.00	\$60,712.00
65	Seoul	Sandal	\$21,483.00	\$4,978.00
Region			\$206,735.00	\$70,916.00

A label can be up to 256 characters.

29

LABEL Statement

Q

A LABEL statement must also be accompanied by an option in the PROC PRINT statement in order for the labels to appear.

Which options are used in conjunction with the LABEL statement?

1. APPEAR
2. DESCRIPTION
3. LABEL
4. NOW
5. PRINT
6. SPLIT=

30

LABEL Statement

The LABEL option enforces variables' labels as column headings.

```
proc print data=sashelp.shoes noobs label;
```

The SPLIT= option specifies the split character, which controls line breaks in column headers and implies the use of labels.

```
proc print data=sashelp.shoes noobs split='*' ;
```

32

FORMAT Statement

The *FORMAT statement* associates formats to variable values.

```
format inventory sales dollar14.2;
```

Partial Output

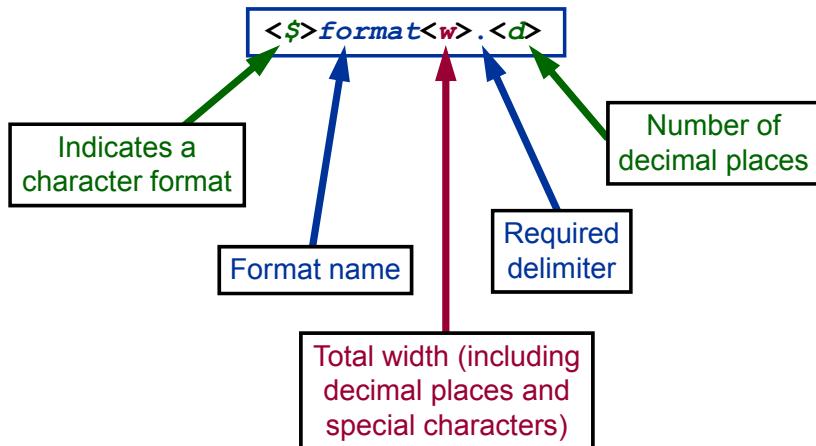

Region=Asia				
Obs	Subsidiary	Product	Total Inventory	Total Sales
57	Bangkok	Boot	\$9,576.00	\$1,996.00
59	Bangkok	Sandal	\$15,087.00	\$3,230.00
62	Seoul	Boot	\$160,589.00	\$60,712.00
65	Seoul	Sandal	\$21,483.00	\$4,978.00
Region			\$206,735.00	\$70,916.00

A *format* is an instruction that SAS uses to write data values.

33

FORMAT Statement

Formats have the following form:

34

FORMAT Statement

Stored Value	Format	Displayed Value
Washington	\$4 .	Wash
1234.4567	8 .0	1234
1234.4567	8 .2	1234 .46
1234.4567	comma8 .2	1,234 .46
1234.4567	dollar9 .2	\$1,234 .46

35

FORMAT Statement

Partial Output

----- Region=Western Europe -----			
Subsidiary	Product	Total Inventory	Total Sales
Copenhagen	Boot	\$4,657.00	\$1,663.00
Geneva	Boot	\$171,030.00	\$41,341.00
	Sandal	\$3,529.00	\$736.00
	Boot	\$301,779.00	\$65,610.00
	Sandal	\$4,618.00	\$977.00
	Boot	\$341,911.00	\$76,349.00
	Sandal	\$24,253.00	\$1,650.00
	Boot	\$289,527.00	\$54,449.00
	Sandal	\$11,111.00	\$5,217.00
Madrid	Boot	\$1,027.00	\$1,179.00
Paris	Boot	\$41,506.00	\$19,196.00
Paris	Sandal	\$23,816.00	\$1,520.00
Rome	Boot	\$209,271.00	\$36,244.00
Rome	Sandal	\$4,611.00	\$1,249.00
Region		\$1,432,646.00	\$307,380.00
		=====	=====
		\$12,956,946.00	\$3,218,979.00

format inventory dollar____.2 sales dollar____.2;

FORMAT Statement

The following program is submitted:

```
proc print data=sales;
  format sales dollar7.2;
run;
```

What is the result if the format width for **dollar** is too narrow to represent the value?

- A. The program fails execution due to errors.
- B. SAS supplies a missing value to the **sales** variable.
- C. SAS fits the value into the space available in the best way that it can.
- D. The program runs with warnings and eliminates the **sales** variable.

FORMAT Statement

Stored Value	Format	Displayed Value
17332	mmddyy6.	061507
17332	mmddyy8.	06/15/07
17332	mmddyy10.	06/15/2007
17332	date7.	15JUN07
17332	date9.	15JUN2007
17332	ddmmyy8.	15/06/07
17332	worddate.	June 15, 2007
17332	weekdate.	Friday, June 15, 2007
17332	monyy7.	JUN2007

40

FORMAT Statement

Desired report:

Obs	birth	hired	retired
1	02/17/1941	05/01/1976	31DEC2006

What two corrections must be made to the following statement to obtain the desired report?

```
format birth hired mmddyy8. retired date9;
```

41

LABEL and FORMAT Statements

LABEL and FORMAT statements assigned in a PROC step are considered **temporary** attributes (apply only for the duration of the step).

LABEL and FORMAT statements assigned in a DATA step are considered **permanent** attributes (stored in the descriptor portion).

Alphabetic List of Variables and Attributes

#	Variable	Type	Len	Format	Informat	Label
6	Inventory	Num	8	DOLLAR12.	DOLLAR12.	Total Inventory
2	Product	Char	14			
1	Region	Char	25			
7	Returns	Num	8	DOLLAR12.	DOLLAR12.	Total Returns
5	Sales	Num	8	DOLLAR12.	DOLLAR12.	Total Sales
4	Stores	Num	8			Number of Stores
3	Subsidiary	Char	12			

43

TITLE Statement

The *TITLE* statement specifies up to 10 lines of text at the top of output.

```
title 'Boot and Sandal Report';
```

Partial Output

----- Region=Asia-----			
Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00
Region		\$206,735.00	\$70,916.00

Created by Tony Smith
Chicago, IL

TITLE is the same as TITLE1.

44

FOOTNOTE Statement

The *FOOTNOTE* statement specifies up to 10 lines of text at the bottom of output.

```
footnote 'Created by Tony Smith';
footnote2 'Chicago, IL';
```

Partial Output

Region=Asia			
Subsidiary	Product	Total Inventory	Total Sales
Bangkok	Boot	\$9,576.00	\$1,996.00
Bangkok	Sandal	\$15,087.00	\$3,230.00
Seoul	Boot	\$160,589.00	\$60,712.00
Seoul	Sandal	\$21,483.00	\$4,978.00
Region		\$206,735.00	\$70,916.00

Created by Tony Smith
Chicago, IL

FOOTNOTE is the same as FOOTNOTE1.

45

TITLE and FOOTNOTE Statements

The TITLE and FOOTNOTE statements are global statements, which means that the statements stay in effect until they are canceled, changed, or you end your SAS session.

The code **title**; cancels all titles.

The code **footnote**; cancels all footnotes.

TITLEn or FOOTNOTEn

- replaces a previous title or footnote with the same number
- cancels all titles or footnotes with higher numbers.

46

TITLE and FOOTNOTE Statements

The following SAS program is submitted:

```
proc print data=shoes1;
  title1 'Shoe Store';
  title2 'Report One';
  title3 'Accounting';
run;
proc print data=shoes2;
  title2 'Report Two';
run;
```

What titles appear in the second procedure output?

- A. **Report Two**
- C. **Report Two
Accounting**
- B. **Shoe Store
Report Two**
- D. **Shoe Store
Report Two
Accounting**

47

OPTIONS Statement

The *OPTIONS statement* changes the value of one or more SAS system options.

```
options nodate nonumber ps=30 ls=64;
```

The OPTIONS statement is a global statement, which means that the options remain in effect until they are canceled, changed, or you end your SAS session.

The OPTIONS statement is not usually included in a step.

Some system options change the appearance of a report.

49

OPTIONS Statement

System Option	Description
DATE NODATE	specifies that the date and the time that the SAS job was initialized appear in the top right corner of each page of output.
NUMBER NONUMBER	specifies that the page number appear in the top right corner of each page of output.
PAGENO=n	specifies a beginning page number for the next page of output.
LS=n LINESIZE=n	specifies the number of characters that can be printed on one page width of output.
PS=n PAGESIZE=n	specifies the number of lines that can be printed per page of output.

50

OPTIONS Statement

The following SAS program is submitted.

```
options nodate nonumber;
proc print data=shoes1;
run;
options pageno=1;
proc print data=shoes2;
run;
```

What is the result of the second report?

- A. The second report has a date and no page number.
- B. The second report has a date and a page number of 1.
- C. The second report has no date and no page number.
- D. The second report has no date and a page number of 1.

51

Common Statements

The following statements have the same function in a number of Base SAS procedures:

- WHERE
- LABEL
- FORMAT
- TITLE
- FOOTNOTE
- OPTIONS

53

Refer to Exercise 2 for Chapter 6 in Appendix A.

6.2 Creating Formats with the FORMAT Procedure

The FORMAT Procedure

The *FORMAT procedure* enables you to define your own formats for variable values.

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                                100 - high = '100+ lbs';
run;
```

Formats determine how variable values are printed.

57

Refer to Exercise 3 for Chapter 6 in Appendix A.

Naming Convention

Format names must be

- 32 characters or less
- different than the name of a format supplied by SAS.

Character formats start with a \$, followed by a letter or underscore.

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                                100 - high = '100+ lbs';
run;
```

Numeric formats start with a letter or underscore.

60

Single Values

On the left side of the equal sign, you can have single values. Character values should be enclosed in quotation marks.

```
proc format;
  value $gender 'F' = 'Female'
    'M' = 'Male'
    other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
    100 - high = '100+ lbs';
run;
```

case-sensitive

You can have multiple single values with commas separating the values.

```
value $gender 'F', 'FEM', 'FEMALE' = 'Female'
      'M', 'MAL', 'MALE' = 'Male';
```

61

Single Values

Q

A format needs to be created for a numeric variable where 0 means NO, 1 means YES, 3 and 4 means UNSURE, and . means MISSING.

```
proc format;
  value code    '0' = 'NO'
    '1' = 'YES'
    '3', '4' = 'UNSURE'
    . = 'MISSING';
run;
```

What is the error in the PROC FORMAT step?

62

Ranges

On the left side of the equal sign, you can have ranges.

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                100 - high = '100+ lbs';
run;
```

For character ranges, each string should be enclosed in quotation marks (example: 'A' – 'Z').

64

Ranges

Q

Given the following code:

```
proc format;
  value group  0 - 50  = 'First Half'
                51 - 100 = 'Second Half';
run;
```

What will be the formatted value of 50.5?

- A. 50.5
- B. First Half
- C. Second Half
- D. missing value

65

Ranges

The less than (<) sign excludes values from ranges.

- Put < after the value if you exclude the first value in a range.
- Put < before the value if you exclude the last value in a range.

50 - 100	Includes 50	Includes 100
50 - < 100	Includes 50	Excludes 100
50 < - 100	Excludes 50	Includes 100
50 < - < 100	Excludes 50	Excludes 100

67

Ranges

Given the following code:

```
proc format;
  value group 0 - < 50 = 'First Half'
            50 -    100 = 'Second Half';
run;
```

What will be the formatted value of 50.5?

- 50.5
- First Half
- Second Half
- missing value

68

Keywords

- OTHER matches all values that do not match any other value or range.
- LOW encompasses lowest possible value.
LOW does not include missing for numeric variables.
LOW does include missing for character variables.
- HIGH encompasses highest possible value.
- LOW - HIGH encompasses all values.

```
proc format;
  value $gender 'F'  = 'Female'
    'M'  = 'Male'
    other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
    100 - high = '100+ lbs';
run;
```

70

Keywords

What is wrong with the keyword in the following example?

```
proc format;
  value $gender  'F'    = 'Female'
    'M'    = 'Male'
    'other' = 'Miscoded';
run;
```

71

Q

Formatted Values

On the right side of the equal sign, you have the formatted values.

Formatted values

- are always quoted strings
- can be up to 32,767 characters.

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                100 - high = '100+ lbs';
run;
```

73

Creating and Using Formats

Create format (no period in format name):

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                100 - high = '100+ lbs';
run;
```

Use format (period in format name):

```
options nodate nonumber ps=30 ls=64;
proc print data=sashelp.class;
  var name sex weight;
  format sex $gender. weight wtrange.;
run;
```

74

Creating and Using Formats

Q

Data Set		
	name	test
1	Jane	D
2	Tom	B
3	Mark	Z
4	Sue	A

Obs	name	test
1	Jane	Needs Improvement
2	Tom	Good
3	Mark	Miscoded
4	Sue	Excellent

```
proc format;
  value $testfmt 'a' = 'Excellent'
                 'b' = 'Good'
                 'c' = 'Average'
                 'd', 'f' = 'Needs Improvement'
                 ' ' = 'Incomplete'
                 other = 'Miscoded';
run;

proc print data=test;
  format test $testfmt;
run;
```

What two issues cause this program not to give the desired results?

75

6.3 Creating Frequency Tables with the FREQ Procedure

The FREQ Procedure

The *FREQ procedure* produces one-way to n -way frequency tables. By default, the procedure generates one-way frequency tables for all data set variables.

```
proc freq data=sashelp.orsales;
run;
```

One-Way Table

The FREQ Procedure

Product Line

Product_Line	Frequency	Percent	Cumulative Frequency	Cumulative Percent
Children	176	19.30	176	19.30
Clothes & Shoes	288	31.58	464	50.88
Outdoors	112	12.28	576	63.16
Sports	336	36.84	912	100.00

 The data set `sashelp.orsales` has eight variables.
Therefore, eight one-way frequency tables are created.

78

TABLES Statement

The *TABLES statement* requests one-way to n -way frequency tables and statistics for those tables.

Product Line				
Product_Line	Frequency	Percent	Cumulative Frequency	Cumulative Percent
Children				
Clothes & Shoes				
Outdoors				
Sports				

Year				
Year	Frequency	Percent	Cumulative Frequency	Cumulative Percent
1999	228	25.00	228	25.00
2000	228	25.00	456	50.00
2001	228	25.00	684	75.00
2002	228	25.00	912	100.00

79

Two-Way Tables

An asterisk between two variables produces a two-way table.

```
proc freq data=sashelp.orsales;
  where product_line in ('Outdoors', 'Sports');
  tables product_line * year;
run;
```

Row Column

80

Two-Way Tables

Table of Product_Line by Year						
		Column				
		1999	2000	2001	2002	Total
Outdoors	Frequency	28	28	28	28	112
	Percent	6.25	6.25	6.25	6.25	25.00
	Row Pct	25.00	25.00	25.00	25.00	
	Col Pct	25.00	25.00	25.00	25.00	
Sports	Frequency	84	84	84	84	336
	Percent	18.75	18.75	18.75	18.75	75.00
	Row Pct	25.00	25.00	25.00	25.00	
	Col Pct	75.00	75.00	75.00	75.00	
Total		112	112	112	112	448
		25.00	25.00	25.00	25.00	100.00

81

Two-Way Tables

The following program is submitted:

```
proc freq data=sashelp.orsales ;
  tables quarter product_category
        year*product_line;
run;
```

Which of the following is **true** regarding the program?

- A. One frequency table is produced.
- B. Two frequency tables are produced.
- C. Three frequency tables are produced.
- D. Four frequency tables are produced.

82

CROSSLIST Option

The *CROSSLIST option* displays two-way tables in column format, instead of cell format.

```
proc freq data=sashelp.orsales ;
  where product_line in ('Outdoors','Sports');
  tables product_line*year / crosslist;
run;
```

Options in the TABLES statement must come after a forward slash.

84

The FREQ Procedure					
Table of Product_Line by Year					
Product_Line	Year	Frequency	Percent	Row Percent	Column Percent
Outdoors	1999	28	6.25	25.00	25.00
	2000	28	6.25	25.00	25.00
	2001	28	6.25	25.00	25.00
	2002	28	6.25	25.00	25.00
	Total	112	25.00	100.00	
Sports	1999	84	18.75	25.00	75.00
	2000	84	18.75	25.00	75.00
	2001	84	18.75	25.00	75.00
	2002	84	18.75	25.00	75.00
	Total	336	75.00	100.00	
Total	1999	112	25.00		100.00
	2000	112	25.00		100.00
	2001	112	25.00		100.00
	2002	112	25.00		100.00
	Total	448	100.00		

85

Statistics

	Default Statistics	Options to Eliminate Statistics
One-Way Tables	Frequency Percent Cumulative Frequency Cumulative Percent	NOPERCENT NOCUM
Two-Way Tables	Frequency Percent Row Percent Column Percent	NOFREQ NOPERCENT NOROW NOCOL

```
tables product_line*year / options;
```

86

Statistics

Q

The following frequency table is desired:

Product Line		
Product_	Frequency	Cumulative
Line		Frequency
Outdoors	112	112
Sports	336	448

Which statement creates the desired report?

- A. `tables product_line;`
- B. `tables product_line / nocum;`
- C. `tables product_line / nopercnt;`
- D. `tables product_line / nocum nopercnt;`

87

NLEVELS Option

The *NLEVELS* option displays the number of levels for all TABLES variables.

```
proc freq data=sashelp.orsales nlevels;
  tables year quarter
    product_line product_category;
run;
```

The FREQ Procedure

Number of Variable Levels

Variable	Label	Levels
Year	Year	4
Quarter	Quarter	16
Product_Line	Product Line	4
Product_Category	Product Category	12

89

 This output will appear before the four one-way frequency tables.

Refer to Exercise 4 for Chapter 6 in Appendix A.

6.4 Creating Summary Reports with the MEANS Procedure

The MEANS Procedure

The *MEANS procedure* computes descriptive statistics for variables across all observations and within groups of observations.

```
proc means data=sashelp.prdsale
            maxdec=2 mean stddev;
    var predict actual;
    class country year;
run;
```

The MEANS Procedure						
Country	Year	N Obs	Variable	Label	Mean	Std Dev
CANADA	1993	240	PREDICT	Predicted Sales	497.20	280.59
			ACTUAL	Actual Sales	504.25	291.83
	1994	240	PREDICT	Predicted Sales	473.71	280.33
			ACTUAL	Actual Sales	524.88	287.08

93

Statistics

Which statistics does the MEANS procedure produce by default?

- A. MEAN, STDDEV, SUM
- B. MEAN, STDDEV, MIN, MAX
- C. N, MEAN, STDDEV, MIN, MAX
- D. N, MEAN, STDDEV, SUM, MIN, MAX

94

Statistics

By default, the MEANS procedure creates a report with N (number of nonmissing values), MEAN, STDDEV, MIN, and MAX.

```
proc means data=sashelp.prdsale;
run;
```

The MEANS Procedure						
Variable	Label	N	Mean	Std Dev	Minimum	Maximum
ACTUAL	Actual Sales	1440	507.1784722	287.0313065	3.0000000	1000.00
PREDICT	Predicted Sales	1440	490.4826389	285.7667904	0	1000.00
QUARTER	Quarter	1440	2.5000000	1.1184224	1.0000000	4.0000000
YEAR	Year	1440	1993.50	0.5001737	1993.00	1994.00
MONTH	Month	1440	12403.00	210.6291578	12054.00	12753.00

96

Statistics

In the PROC MEANS statement, you can specify which statistics to compute and the order in which to display them in the output.

```
proc means data=sashelp.prdsale sum range;
run;
```

The MEANS Procedure			
Variable	Label	Sum	Range
ACTUAL	Actual Sales	730337.00	997.0000000
PREDICT	Predicted Sales	706295.00	1000.00
QUARTER	Quarter	3600.00	3.0000000
YEAR	Year	2870640.00	1.0000000
MONTH	Month	17860320.00	699.0000000

97

MAXDEC= Option

The *MAXDEC= option* in the PROC MEANS statement specifies the maximum number of decimal places to display the statistics in the output.

Without MAXDEC=

		N	Mean	Std Dev	Minimum	Maximum
ACTUAL	Actual Sales	1440	507.1784722	287.0313065	3.0000000	1000.00
PREDICT	Predicted Sales	1440	490.4826389	285.7667904	0	1000.00
QUARTER	Quarter	1440	2.5000000	1.1184224	1.0000000	4.0000000
YEAR	Year	1440	1993.50	0.5001737	1993.00	1994.00
MONTH	Month	1440	12403.00	210.6291578	12054.00	12753.00

With MAXDEC=2

		N	Mean	Std Dev	Minimum	Maximum
ACTUAL	Actual Sales	1440	507.18	287.03	3.00	1000.00
PREDICT	Predicted Sales	1440	490.48	285.77	0.00	1000.00
QUARTER	Quarter	1440	2.50	1.12	1.00	4.00
YEAR	Year	1440	1993.50	0.50	1993.00	1994.00
MONTH	Month	1440	12403.00	210.63	12054.00	12753.00

VAR Statement

The *VAR statement* identifies the analysis variables and specifies their order in the results.

```
proc means data=sashelp.prdsale
            maxdec=2 n mean;
    → var predict actual;
    run;
```

The MEANS Procedure

Variable	Label	N	Mean
PREDICT	Predicted Sales	1440	490.48
ACTUAL	Actual Sales	1440	507.18

The MEANS procedure analyzes all numeric variables if you omit the VAR statement.

CLASS Statement

The *CLASS statement* specifies one or more variables that the procedure uses to group the data.

Country	Year	N	Obs	Variable	Label	N	Mean
CANADA	1993	240	PREDICT	Predicted Sales	240	497.20	
	1994	240	ACTUAL	Actual Sales	240	504.25	
GERMANY	1993	240	PREDICT	Predicted Sales	240	473.71	
	1994	240	ACTUAL	Actual Sales	240	524.88	
U.S.A.	1993	240	PREDICT	Predicted Sales	240	488.00	
	1994	240	ACTUAL	Actual Sales	240	530.85	
U.S.A.	1993	240	PREDICT	Predicted Sales	240	476.81	
	1994	240	ACTUAL	Actual Sales	240	494.14	

```

100
proc means data=sashelp.prdsale
            maxdec=2 n mean;
  var predict actual;
  class country year;
run;

```

100

CLASS Statement

Adding a CLASS statement adds the N Obs column.

Country	Year	N	Obs	Variable	Label	N	Mean
CANADA	1993	240	PREDICT	Predicted Sales	240	497.20	
	1994	240	ACTUAL	Actual Sales	240	504.25	
GERMANY	1993	240	PREDICT	Predicted Sales	240	473.71	
	1994	240	ACTUAL	Actual Sales	240	524.88	
U.S.A.	1993	240	PREDICT	Predicted Sales	240	488.00	
	1994	240	ACTUAL	Actual Sales	240	530.85	
U.S.A.	1993	240	PREDICT	Predicted Sales	240	476.81	
	1994	240	ACTUAL	Actual Sales	240	494.14	

number of nonmissing values for the analysis variable

number of observations for each unique combination of the class variables

101

Q

CLASS Statement

For a given data set, there are 20 observations with a **Country** value of GERMANY. Of those 20 observations, only 15 observations have a value for PREDICT.

Which output is correct?

A.

Country	Obs	Variable	Label	N
GERMANY	15	PREDICT	Predicted Sales	20

B.

Country	Obs	Variable	Label	N
GERMANY	20	PREDICT	Predicted Sales	15

102

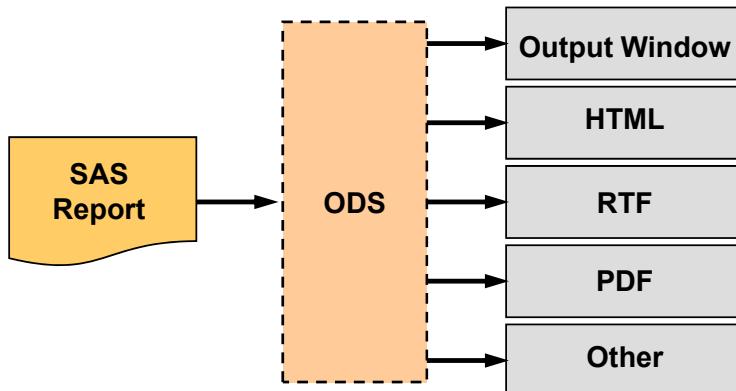

Refer to Exercise 5 for Chapter 6 in Appendix A.

6.5 Directing Reports to External Files with ODS

Output Delivery System

ODS statements enable you to create output in a variety of forms.

107

Output Delivery System

Q

Which ODS destination is used to direct reports to the Output window?

- A. LISTING
- B. PRINT
- C. OUTPUT
- D. WINDOW

108

ODS HTML Statement

The *ODS HTML statement* opens or closes the HTML destination, which produces HyperText-Markup-Language files that are viewable with a Web browser.

```
ods html file='gnp.html';

proc print data=sashelp.gnp;
  ...
run;

proc means data=sashelp.gnp;
  ...
run;

ods html close;
```

110

ODS HTML Statement

My Report

DATE	govt purchases of goods and services	net exports of goods and services	gross national product (\$billions)
1985Q1	784.4	-53.1	3925.6
1985Q2	801.7	-74.3	3979
1985Q3	840.2	-81.2	4047
1985Q4	856.7	-103.2	4107.9

My Report

The MEANS Procedure

Analysis Variable : GNP gross national product (\$billions)				
N	Mean	Std Dev	Minimum	Maximum
4	4014.88	79.4621660	3925.60	4107.90

111

ODS HTML Statement

What is wrong with the following program?

```
ods html file='rent.pdf';

proc print data=sashelp.rent;
  title 'Rent Report';

ods close;

run;
```

112

ODS RTF and PDF Statements

- The *ODS RTF statement* opens or closes the RTF destination, which produces Rich-Text-Format files that are viewable with a word processor.
- The *ODS PDF statement* opens or closes the PDF destination, which produces Portable-Document-Format files that are viewable with an Adobe product.

```
ods rtf file='shoes.rtf';
ods pdf file='shoes.pdf';

proc freq data=sashelp.shoes;
  ...
run;

ods rtf close;
ods pdf close;
```

114

ODS RTF and PDF Statements

Region Frequency Table
The FREQ Procedure

Region	Frequency	Percent	Cumulative Frequency	Cumulative Percent
Africa	56	14.18	56	14.18
Asia	14	3.54	70	17.72

RTF

Region Frequency Table
The FREQ Procedure

Region	Frequency	Percent	Cumulative Frequency	Cumulative Percent
Africa	56	14.18	56	14.18
Asia	14	3.54	70	17.72
Canada	37	9.37	107	27.09
Central America/Caribbean	32	8.10	139	35.19
Eastern Europe	31	7.85	170	43.04
Middle East	24	6.08	194	49.11
Pacific	45	11.39	239	60.51
South America	54	13.67	293	74.18

Western Europe	62	15.70	395	100.00

PDF

115

Multiple ODS Destinations

Q

Which statement can be used to close multiple ODS destinations?

A. `ods close;`

B. `ods all close;`

C. `ods _all_ close;`

D. `ods _destination_ close;`

116

Multiple ODS Destinations

The ODS _ALL_ CLOSE statement closes **all** open destinations including the LISTING destination.

```
ods listing;
ods html file='shoes.html';
ods rtf file='shoes.rtf';
ods pdf file='shoes.pdf';

proc print data=sashelp.shoes;
  ...
run;

ods _all_ close;
ods listing;
```

118

Destinations Used with Excel

Which destination **cannot** create a file that can be opened in Excel?

- A. CSVALL
- B. EXCEL
- C. EXCELXP
- D. MSOFFICE2K

119

Destinations Used with Excel

- The CSVALL destination creates a CSV (comma-separated value) file.
- The EXCELXP destination creates an XML (Extensible Markup Language) file.
- The MSOFFICE2K destination creates an HTML (HyperText Markup Language) file.

```
ods csvall file='shoes.csv';
ods tagsets.excelxp file='shoes.xml';
ods msoffice2k file='shoes.html';

proc print data=sashelp.shoes;
  ...
run;

ods _all_ close;
```

121

Refer to Exercise 6 for Chapter 6 in Appendix A.

Chapter 7 Additional Information

7.1	More Specifics about the SAS Base Programming Exam	7-3
7.2	Additional Preparation Resources.....	7-7
7.3	Test-Taking Strategies.....	7-12

7.1 More Specifics about the SAS Base Programming Exam

SAS Base Programming for SAS®9

After completing the exam, you receive your score.

3

GRADE: Pass

You will receive two e-mails from the SAS Global Certification Program.

- The first e-mail contains your logo access and other pertinent information.
- The second e-mail includes your certificate.

These e-mails are sent to the e-mail address provided to Prometric at exam registration.

Please allow at least two weeks to receive your e-mails.

4

SAS Advanced Programming Exam for SAS®9

After you pass the SAS Base Programming Exam, the SAS Advanced Programming Exam for SAS®9 is required to obtain the Advanced Programmer Credential.

SAS Certified Base Programmer Credential for SAS®9

- SAS Base Programming Exam for SAS®9

SAS Certified Advanced Programmer Credential for SAS®9

- SAS Base Programming Exam for SAS®9
- SAS Advanced Programming Exam for SAS®9

5

SAS Advanced Programming Exam for SAS®9

The intended candidate for the SAS Advanced Programming Exam is someone with current SAS programming experience in the following three content areas:

1. Accessing Data Using SQL
2. Macro Processing
3. Advanced Programming Techniques

In addition, the candidate must be familiar with the enhancements and new functionality available in SAS®9 for the content areas.

6

SAS Advanced Programming Exam for SAS®9

To help candidates prepare for this exam, SAS offers a choice of instructor-led training or self-study options.

SAS Advanced Programming Exam for SAS 9			
Instructor-led training (US)	Self-paced e-learning	Books	Certification Training Packages (US)
<ul style="list-style-type: none">▶ SAS Programming 3: Advanced Techniques and Efficiencies▶ SAS SQL 1: Essentials▶ SAS Macro Language 1: Essentials	<ul style="list-style-type: none">▶ Advanced SAS Programming▶ SAS Certification Practice Exam: Advanced Programming for SAS 9	SAS Certification Prep Guide: Advanced Programming for SAS 9	SAS Advanced Programming Exam Preparation Packages

7

Recertification

- Recertification is not required for individuals holding versioned certification credentials.
- SAS Certified Base Programmer for SAS®9 is a versioned certification credential.

8

Retaking the Exam

- A candidate can retake an exam three times in a 12-month period.
- A candidate must wait a minimum of 30 calendar days between attempts.
- Exams that do not comply with the retake examination policy will be considered invalid.
- Exam retakes require payment of the full exam fee and are not discounted.

7.2 Additional Preparation Resources

Additional Preparation Resources

Taking this review course is not a guarantee that you will pass the exam.

This review course provides practice in multiple-choice format strategies, familiarizes you with SAS terminology, and refreshes your mind on topics learned but not used.

In addition, this course helps you to determine in what areas you need additional preparation and experience.

11

Exam Preparation Options

Below are some of the ways a candidate can prepare for the SAS Base Programming Exam.

SAS Base Programming Exam for SAS 9			
Instructor-led training (US)	Self-paced e-learning	Books	Certification Training Packages (US)
<ul style="list-style-type: none">▶ SAS Programming 1: Essentials▶ SAS Programming 2: Data Manipulation Techniques▶ SAS Certification Review: Base Programming for SAS 9	<ul style="list-style-type: none">▶ SAS Programming 1: Essentials▶ SAS Programming 2: Data Manipulation Techniques▶ SAS Certification: Base Programming Practice Exam	SAS Certification Prep Guide: Base Programming for SAS 9	SAS Base Programming Exam Preparation Packages

An additional resource is the online documentation.

12

Instructor-led Training (U.S.)

The majority of topics tested are presented in two three-day courses that are offered at SAS training centers or via the Live Web format.

- SAS® Programming 1: Essentials
- SAS® Programming 2: Data Manipulation Techniques

13

Instructor-led Training (U.S.)

SAS Programming 1: Essentials

[Overview](#) [Prerequisites](#) [Course Outline](#) [Course Materials](#) [System Requirements](#)

This course is for users who want to learn how to write SAS programs. It is the entry point to learning SAS programming and is a prerequisite to many other SAS courses. If you do not plan to write SAS programs and you prefer a point-and-click interface, you should attend the [SAS Enterprise Guide 1: Querying and Reporting](#) course.

This course can help prepare you for the following certification exam(s): [SAS Base Programming Exam for SAS 9](#).

Learn how to

- navigate the SAS windowing environment
- read various types of data into SAS data sets
- validate and clean SAS data sets
- create SAS variables and subset data
- combine SAS data sets
- create and enhance listing and summary reports.

Who should attend

Anyone getting started writing SAS programs

Formats available

Duration

14

Instructor-led Training (U.S.)

SAS Programming 2: Data Manipulation Techniques

Overview Prerequisites Course Outline Course Materials System Requirements

This course is for those who need to learn data manipulation techniques using SAS DATA and procedure steps to access, transform, and summarize SAS data sets. The course builds on the concepts that are presented in the [SAS Programming 1: Essentials](#) course and is not recommended for beginning SAS software users.

This course can help prepare you for the following certification exam(s): [SAS Base Programming Exam for SAS 9](#).

Learn how to

- control SAS data set input and output
- combine SAS data sets
- summarize, read, and write different types of data
- perform DO loop and SAS array processing
- transform character, numeric, and date variables

Who should attend

Business analysts and SAS programmers

Self-Paced e-Learning

SAS Certification Practice Exam: Base Programming for SAS 9

Overview

This practice exam tests the same knowledge and skills as the SAS Base Programming for SAS 9 certification exam. The format of the questions on both exams is identical, and all topics on the practice exam are proportionally weighted to match the Certification exam.

You should be aware of the following differences between this practice exam and the official Certification exam:

- The SAS Base Programming for SAS 9 certification exam contains 70 test questions, while the practice exam contains 50 questions.
- The practice exam is delivered to you in one continuous HTML page. The Certification exam questions are delivered one per screen.
- The Certification exam has a time limit of 120 minutes, and a timer is provided on each screen to help you track your exam time. There is no timer in the practice exam. To best simulate the actual time allowed for the Certification exam, you should allow 85 minutes for the practice exam.

Successful performance on the practice exam does not guarantee successful performance on the Certification exam.

Who should attend

New or experienced SAS users who want to prepare for the SAS Base Programming exam for SAS 9

Formats available

 e-Learning: 1.5 hours

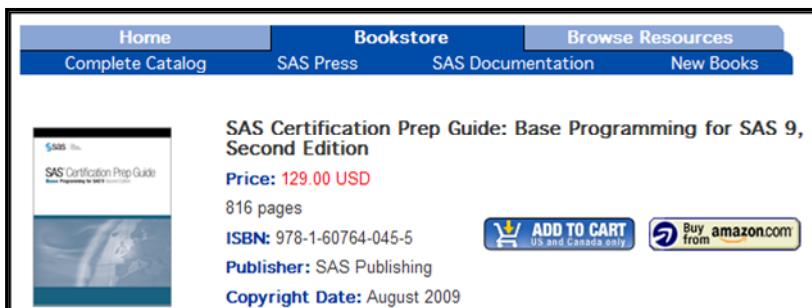

License Period: 180 days

<http://support.sas.com/training/elearn>

16

Books

The preparation guide is a hard-copy version of the self-paced e-learning course, excluding the practice exam.

The screenshot shows a navigation bar with 'Home', 'Bookstore', and 'Browse Resources' tabs. Under 'Bookstore', there are links for 'Complete Catalog', 'SAS Press', 'SAS Documentation', and 'New Books'. The main content area displays the book 'SAS Certification Prep Guide: Base Programming for SAS 9, Second Edition'. It includes a thumbnail image of the book, its title, price (\$129.00 USD), page count (816 pages), ISBN (978-1-60764-045-5), publisher (SAS Publishing), and copyright date (August 2009). It also features 'ADD TO CART' and 'Buy from Amazon.com' buttons.

17

<http://support.sas.com/publishing>

Online Documentation

Documentation is provided with all SAS products and features.

The documentation includes SAS OnlineDoc for the Web and access to PDF versions of most documentation.

SAS Product Documentation

[Products Index A-Z](#)

Documentation is provided with all SAS products. Most of that documentation is also available from this site. Use the A-Z index below to find the documentation for the products you use.

Internet access not always available? Purchase over 100 SAS 9.2 reference books representing over 30 products in SAS 9.2 OnlineDoc: PDF Files. Priced for the individual user but also approved for your business intranet, it's a great value. [Available for purchase in our online bookstore.](#)

SAS Certification Web Site

The global standard for SAS software expertise for 10 years running!

As a hiring manager for Quintiles, a global contract research organization, one of the most important credentials I look for when reviewing resumes is the SAS Certification. Based on my experience, candidates who are SAS Certified are more analytical and are likely to possess stronger SAS programming and debugging skills. In addition, I have increased confidence in these types of candidates who will generally be more successful. Because SAS training is important at Quintiles, all SAS programmers are encouraged to get advanced SAS Certification.

SUNIL GUPTA
 Associate Director
 Statistical Programming
 Quintiles

7.3 Test-Taking Strategies

Before the Exam

- Extend studying and reviewing sessions over days or weeks.
- Do not cram the night before.
- Practice answering multiple choice SAS questions.
- Practice exam questions under timed conditions.
- Determine a plan for how you will use the allotted exam time.
- Get a full night's sleep before the exam.
- Arrive early to the exam and take a moment to relax.
- Listen attentively to the instructions given by the staff.
- Read the exam directions carefully.

22

During the Exam

- Maintain a positive attitude.
- Read each question carefully and thoroughly.
- Formulate your answer before reading the options.
- Eliminate unlikely options first.
- Be sure to read all options before selecting one.
- Pace yourself so that you have enough time to answer every question.
- Leave no questions unanswered.

23

continued...

During the Exam

- Rely on your first impression.
- Do not be afraid to change an answer if you feel strongly about it.
- Do not be discouraged if you cannot answer a question.
- Skip questions that you cannot answer, and return to those questions after completing the remainder of the exam.
- Plan to finish early and have time for review.
- Return to difficult questions that you marked for review.

A.1 Exercises

Chapter 1

1. Fundamental Concepts

Answer TRUE or FALSE to the following sentences.

- a. _____ The two types of steps that can make up a SAS program are DATA and PROC.
- b. _____ A DATA step must use a SAS data set as input.
- c. _____ A statement always ends in a colon.
- d. _____ A global statement only stays in effect for the subsequent step.
- e. _____ The LIBNAME statement assigns a logical name to a SAS data library.
- f. _____ Data sets are referenced using a four-level name.
- g. _____ Data sets located in the Sasuser data library are considered temporary.
- h. _____ A variable name and the name of a data set can be up to 32 characters long.
- i. _____ By default, a variable name can contain special characters such as a dash (-).
- j. _____ A numeric variable is stored as 32 bytes by default.
- k. _____ A numeric variable can be stored with digits, decimal point, comma, minus sign, and E for scientific notation.
- l. _____ A character variable is stored as 1 to 32,767 bytes.
- m. _____ A SAS date value represents the number of days between January 1, 1960, and a specific date.
- n. _____ A missing numeric value is represented with a zero.
- o. _____ A missing character value is represented with a blank.
- p. _____ The DESCRIPTOR procedure views the descriptor portion of a SAS data set.
- q. _____ A statement that starts with an asterisk is a SAS comment.
- r. _____ The SAS log contains messages starting with the words NOTE, SUGGESTION, and ERROR.

Chapter 2

1. Input and Output Data Sets

The SAS data set **company.sales** has three variables (**product**, **price**, and **quantity**). A new data set **work.sales** must be created. The new data set needs to contain two variables (**product** and **total**). The variable **total** is the result of **price** multiplied by **quantity**.

Complete the following program based on the previous scenario:

```
data _____;  
  set _____;  
  keep _____;  
  total = _____;  
run;
```

2. Multiple Data Sets

The SAS data set **sashelp.class** has five variables (**name**, **sex**, **age**, **height**, and **weight**) and 19 observations (9 observations with **sex='F'** and 10 observations with **sex='M'**).

Answer the questions based on the previous information and the following program:

```
data work.female(drop=height)  
  work.everyone(keep=name weight height);  
  set sashelp.class;  
  if sex='F' then output work.female;  
  output work.everyone;  
run;
```

- a. What is the input data set? _____
- b. How many output data sets are being created? _____
- c. How many observations are in **work.female**? _____
- d. How many observations are in **work.everyone**? _____
- e. What variables are in **work.female**? _____

3. WHERE and Subsetting IF Statements

Below is a partial view of the **work.sales** data set:

VIEWTABLE: Work.Sales					
	DATE	STATE	PRODUCT	actual	predict
575	14184	Florida	DESK	1852	2043
576	14214	Florida	DESK	1211	2146
577	13515	Texas	SOFA	1151	465
578	13546	Texas	SOFA	1630	103

A new data set **work.subset** must be created. The new data set should only contain observations with a state equal to Texas, a date less than January 1, 1998, and a difference greater than 1000.

Complete the following program as efficiently as possible based on the previous scenario:

```
data subset;
  set sales;

  where _____;

  difference=actual-predict;

  if _____;

run;
```

4. The SORT Procedure

Answer the questions based on the following program:

```
proc sort data=sashelp.shoes
  out=shoes;
  by descending region product;
run;
```

- What is the input data set? _____
- What is the output data set? _____
- Where is the output data set stored? _____
- How many variables are used to sort the data set? _____
- Does the DESCENDING option apply to the **region** variable? _____
- Does the DESCENDING option apply to the **product** variable? _____
- Which variable is considered the primary sort variable? _____
- What other statements can be added to the SORT procedure? _____
- Does the SORT procedure create a report? _____

5. DATA Step Merge

Below is the input data set **work.employees**:

VIEWTABLE: Work.Employees		
	name	id
1	Troy	12649
2	Melissa	38901
3	Larry	49255
4	Tonya	56391

Below is the input data set **work.salaries**:

VIEWTABLE: Work.Salaries		
	idnum	salary
1	12649	52000
2	49255	75000
3	56391	89000
4	88376	66000

Below is the output data set **work.empsal**:

VIEWTABLE: Work.Empsal			
	name	idnum	salary
1	Troy	12649	52000
2	Larry	49255	75000
3	Tonya	56391	89000

Add the appropriate statement to the following program to create the output data set based on the input data sets:

```
data empsal;  
  _____  
  _____  
  _____  
  by idnum;  
  if emp=1 and sal=1;  
run;
```

Chapter 3

1. Program Data Vector (PDV)

```
input state $ 1-2
      @5 date mmddyy10. @18 populat commal5.
      @35 city1 $ city2 $;
```

Given the previous INPUT statement, create the PDV that is created at compile time. Include the variable name, the variable type (char or num), and the variable byte size.

Name						
Type						
Size						

3. Definitions Applying to Raw Data Files

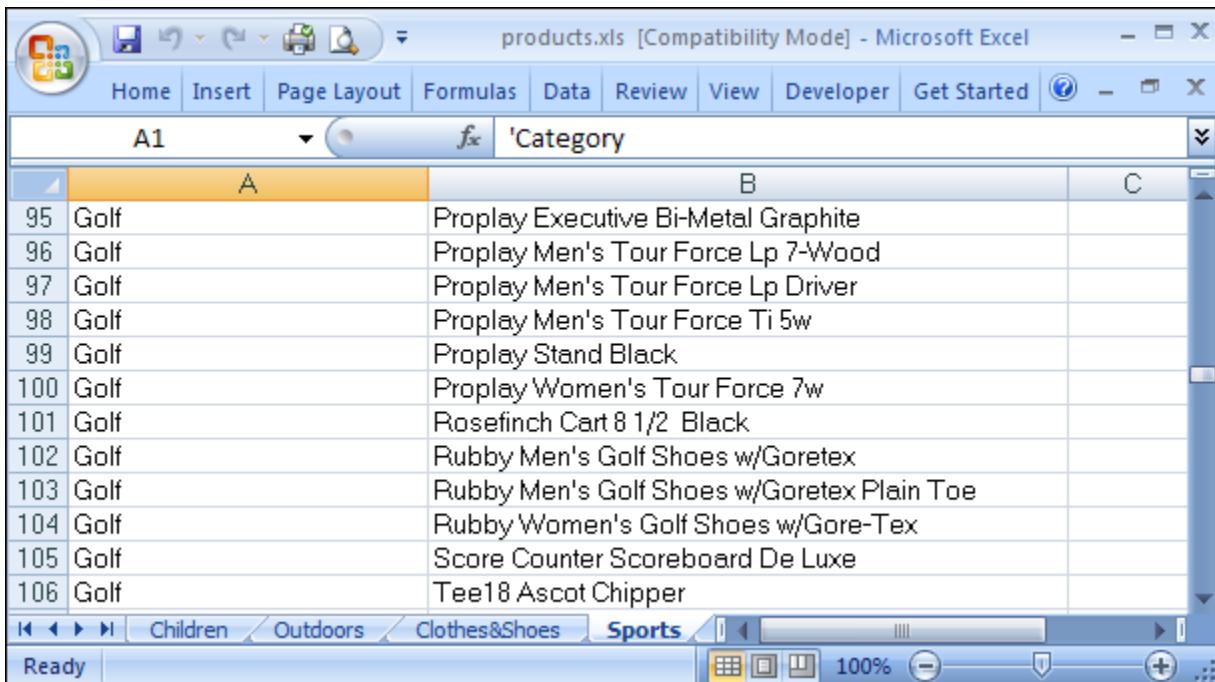

Place the appropriate letter before each item.

<input type="checkbox"/>	DLM=	<input type="checkbox"/>	: MODIFIER
<input type="checkbox"/>	DSD	<input type="checkbox"/>	/
<input type="checkbox"/>	MISSOVER	<input type="checkbox"/>	#N
<input type="checkbox"/>	INFORMAT		

- a. A line-pointer control that advances the pointer to column 1 of the next input record
- b. An option that prevents an INPUT statement from reading a new input data record if it does not find values in the current input line for all the variables in the statement
- c. An option that specifies a delimiter to be used for LIST input
- d. Applies an informat to the field and ignores the width
- e. An option that treats two consecutive delimiters as a missing value
- f. A line-pointer control that advances the pointer to column 1 of record N
- g. An instruction that SAS uses to read data values into a variable

4. Reading Excel Files

The Excel workbook named **products.xls** contains four worksheets. Each sheet contains two columns: **category** and **name**.

	A	B
95	Golf	Proplay Executive Bi-Metal Graphite
96	Golf	Proplay Men's Tour Force Lp 7-Wood
97	Golf	Proplay Men's Tour Force Lp Driver
98	Golf	Proplay Men's Tour Force Ti 5w
99	Golf	Proplay Stand Black
100	Golf	Proplay Women's Tour Force 7w
101	Golf	Rosefinch Cart 8 1/2 Black
102	Golf	Rubby Men's Golf Shoes w/Goretex
103	Golf	Rubby Men's Golf Shoes w/Goretex Plain Toe
104	Golf	Rubby Women's Golf Shoes w/Gore-Tex
105	Golf	Score Counter Scoreboard De Luxe
106	Golf	Tee18 Ascot Chipper

Find the five mistakes in the following program:

```

libname prod 'products';

proc contents data=prod.all;
run;

data work.golf;
  set prod.'sports$';
  where category='Golf';
run;

libname clear;

proc print data=work.golf;
run;

```

Chapter 4

1. Assignment Statements

Answer TRUE or FALSE to the following comments based on the given assignment statement:

```
total = num1 + num2 + num3;
```

_____ The variable **total** is a numeric variable.

_____ The values num1, num2, and num3 are constants.

_____ If num2 is missing, then **total** will be missing.

```
fullname = 'Ms. or Mr.' || name;
```

_____ The variable **fullname** is a numeric variable.

_____ The value 'Ms. or Mr.' is a constant.

_____ The value || is an operator.

```
birthdate = '12FEB1992'd;
```

_____ The variable **birthdate** is a character variable.

_____ The byte size of **birthdate** is 9 bytes.

_____ The value '12FEB1992'd is an operator.

```
phonenum = '888-999-0000';
```

_____ The variable **phonenum** is a character variable.

_____ The byte size of **phonenum** is 8 bytes.

_____ The value '888-999-0000' is an operator.

2. IF-THEN DO / ELSE DO Statements

Answer the questions based on the following program:

```
data newprice;
  infile 'raw-data-file';
  input mfg $ type $ price;
  length saletype $ 18;
  if mfg='Crew' then do;
    pct=0.75;
    saleprice = price * pct;
    saletype = '25% off';
  end;
  else if mfg='Hi-fly' then do;
    pct=0.70;
    saleprice = price * pct;
    saletype = '30% off';
  end;
  else do;
    pct=0.90;
    saleprice = price * pct;
    saletype = '10% Storewide Sale';
  end;
  format price saleprice dollar8.2;
run;
```

- a. How many DO blocks are in the program? _____
- b. How many variables will be assigned values if an expression is true? _____
- c. How many of those variables are numeric? _____
- d. What is the byte size of **pct**? _____
- e. What would be the byte size of **saletype** if the LENGTH statement were not part of the program? _____
- f. How many ELSE statements are in the program? _____
- g. Why is the word ELSE used? _____
- h. Why are the DO blocks needed? _____
- i. What stops each DO block? _____
- j. Will the value of **pct** ever be missing? _____

3. Multiple BY-Group Variables

Given the following statement:

```
by state city;
```

Fill in the following table with the correct **Total Donation** for each BY group and the **FIRST.** and **LAST.** values:

State	City	Donation	Total Donation	first. State	last. State	first. City	last. City
NC	Charlotte	2000					
NC	Charlotte	9000					
NC	Charlotte	4000					
NC	Greenville	6000					
NC	Greenville	3000					
SC	Greenville	5000					
SC	Greenville	2000					
SC	Pelzer	5000					

The variable **Total Donation** represents a running total within each BY group.

Chapter 5

1. Character Functions

Place the appropriate letter before each function.

_____	CAT	_____	PROPCASE
_____	CATS	_____	RIGHT
_____	CATT	_____	SCAN
_____	CATX	_____	SUBSTR
_____	FIND	_____	TRANWRD
_____	INDEX	_____	TRIM
_____	LEFT	_____	UPCASE
_____	LOWCASE		

- a. Concatenates character strings and removes leading and trailing blanks
- b. Selects a given word from a character expression
- c. Replaces or removes all occurrences of a word in a character string
- d. Converts all letters in an argument to lowercase
- e. Right-aligns a character expression
- f. Concatenates character strings without removing leading or trailing blanks
- g. Searches a character expression for a string of characters with the capability of ignoring case and trimming trailing blanks
- h. Extracts a substring from an argument
- i. Converts all letters in an argument to uppercase
- j. Concatenates character strings and removes trailing blanks
- k. Removes trailing blanks from character expressions
- l. Searches a character expression for a string of characters
- m. Left-aligns a character expression
- n. Concatenates character strings, removes leading and trailing blanks, and inserts separators
- o. Converts all words in an argument to proper case

2. FIND Function

The following program is submitted:

```
data tonguetwister;
length string $ 37;
string='How much WOOD would a woodchuck chuck';
num1=find(string,'wood');
num2=find(string,'wood','i');
num3=find(string,'wood ','t');
num4=find(string,'wood ','it');
num5=find(string,'WOOD ','it',15);
num6=find(string,'WOOD ','it',-15);
num7=find(string,'wood',40);
num8=find(string,'WOOD','i',-40);
run;
```

Fill in the following table with the correct value of **num1** through **num8**:

num1	num2	num3	num4	num5	num6	num7	num8

3. Truncation Functions

Fill in the following table based on the value of **num** and the truncation function:

num	ceil (num)	floor (num)	int (num)	round (num)
2.75				
-2.75				
23.1234				
-23.1234				

4. Automatic Data Conversions

Fill in the following tables with the converted value assuming automatic conversion:

Value of Character Variable	Value of Numeric Variable (8 bytes)
162400	
\$162,400	
49275.937	
+24	
-73.5	
01234	
52E3	
01/01/1960	

Automatic character-to-numeric conversion using the W. informat

Value of Numeric Variable (8 bytes)	Value of Character Variable (12 bytes)
162400	
49275.937	
-73.5	
52E3	
0	

Automatic numeric-to-character conversion using the BEST12. format

5. DO Loops and Arrays

The following is the input data set, **Weekly**:

VIEWTABLE: Work.Weekly					
	name	week1	week2	week3	week4
1	Jack	25	32	48	33
2	Susan	10	12	10	10

The following is the desired output data set, **WeeklyRotate**:

VIEWTABLE: Work.Weeklyrotate			
	name	week	miles
1	Jack	1	25
2	Jack	2	32
3	Jack	3	48
4	Jack	4	33
5	Susan	1	10
6	Susan	2	12
7	Susan	3	10
8	Susan	4	10

Complete the following program to create the desired output data set:

```

data WeeklyRotate;
  set Weekly;

  array run _____;

  do _____;

    miles = _____;

    output;

  _____;

  drop week1 - week4;
run;

```

Chapter 6

1. The PRINT Procedure

Place the appropriate letter before each item.

<input type="checkbox"/>	BY Statement	<input type="checkbox"/>	PAGEBY Statement
<input type="checkbox"/>	FOOTNOTE Statement	<input type="checkbox"/>	SUM Statement
<input type="checkbox"/>	FORMAT Statement	<input type="checkbox"/>	TITLE Statement
<input type="checkbox"/>	LABEL Statement	<input type="checkbox"/>	VAR Statement
<input type="checkbox"/>	NOOBS Option	<input type="checkbox"/>	WHERE Statement
<input type="checkbox"/>	OPTIONS Statement		

- a. Puts each separate section of a BY group on separate pages
- b. Changes the value of one or more SAS system options
- c. Suppresses the column in the output that identifies each observation by number
- d. Specifies up to 10 lines of text at the top of output
- e. Subsets the input data set by specifying certain conditions that each observation must meet
- f. Assigns descriptive labels to variable names
- g. Produces a separate section of the report for each BY group
- h. Selects variables that appear in the report and determines the variables order
- i. Specifies up to 10 lines of text at the bottom of output
- j. Associates formats to variable values
- k. Totals values of numeric variables

2. The PRINT Procedure

The following is the desired report (partial output):

Predicted versus Actual Sales				
----- Country=Mexico -----				
Country	Year	Predicted		
		Sales	Actual	Sales
Mexico	1995	\$282	\$189	
Mexico	1995	\$276	\$266	
Mexico	1995	\$807	\$241	
Mexico	1995	\$782	\$451	
Mexico	1995	\$381	\$126	

Find the six syntax mistakes in the following program:

```
options nodate numberno ps=30 ls=64;
proc print data=sashelp.prdsal2 nobs headers;
  where country=Mexico;
  var country year predict actual;
  by country;
  sum predict actual;
  label predict='Predicted Sales'
    actual='Actual Sales';
  format predict actual dollar12;
  title 'Predicted versus Actual Sales'
run;
```

3. The FORMAT Procedure

Answer the questions based on the following program:

```
proc format;
  value $gender 'F'  = 'Female'
                'M'  = 'Male'
                other = 'Miscoded';
  value wtrange low - <100 = 'Under 100 lbs'
                100 - high = '100+ lbs';
run;
proc print data=sashelp.class;
  var name sex weight;
  format sex $gender. weight wtrange.;
run;
```

- a. How many formats are created in the PROC FORMAT step? _____
 - b. Is \$GENDER a character or a numeric format? _____
 - c. Is WTRANGE a character or a numeric format? _____
 - d. What is the maximum length of a format name? _____
 - e. What must start a character format name? _____
 - f. What are the three keywords used in the VALUE statements? _____
 - g. Does the less than (<) sign include or exclude values from ranges? _____
 - h. Does the LOW keyword include a numeric missing value? _____
 - i. What special character is used at the end of the format name when you use a format? _____
 - j. Are these formats temporary or permanent? _____
 - k. Does the PROC FORMAT step refer to the data set and the variable that will use the format? _____
-

4. The FREQ Procedure

The following is the desired report:

Report One		
The FREQ Procedure		
Number of Variable Levels		
Variable	Label	Levels
Product_Category	Product Category	12
Product Category		
Product_Category	Frequency	Percent
Assorted Sports Articles	64	7.02
Children Sports	176	19.30
Clothes	240	26.32
Golf	32	3.51
Indoor Sports	48	5.26
Outdoors	112	12.28
Racket Sports	48	5.26
Running - Jogging	32	3.51
Shoes	48	5.26
Swim Sports	16	1.75
Team Sports	64	7.02
Winter Sports	32	3.51

Complete the following program to create the desired report:

```
options nodate nonumber ps=50 ls=74;

proc freq data=sashelp.orsales ;
  title 'Report One';
run;
```

5. The MEANS Procedure

The following is the desired report:

Product Sales Report			
The MEANS Procedure			
Analysis Variable : ACTUAL Actual Retail Sales			
State/Province	N Obs	Sum	Median
Illinois	5760	410977	71
New York	1152	1705493	1445

Confidential

Complete the following program to create the desired report:

```
options nodate nonumber ps=18 ls=74;

proc means data=sashelp.prdsal2 _____;
  where state in ('New York','Illinois');
  _____;
  _____;
  _____;

  label actual='Actual Retail Sales';
  title 'Product Sales Report';
  footnote 'Confidential';
run;
```

6. Output Delivery System

Fill in the blanks in the following program to complete the program and answer the questions.

```
ods listing;

ods html _____ = 'steel.html';

ods _____ file = 'steel.xml';

proc sort data=sashelp.steel out=steel;
  by date;
run;

proc print data=steel;
run;

proc freq data=steel;
  tables date;
run;

ods _all_ _____;

ods listing;
```

- a. How many destinations are open in the program? _____
- b. How many reports are sent to the open destinations? _____

A.2 Solutions

Chapter 1

1. Fundamental Concepts

- a. TRUE The two types of steps that can make up a SAS program are DATA and PROC.
- b. FALSE A DATA step must use a SAS data set as input.
- c. FALSE A statement always ends in a colon.
- d. FALSE A global statement only stays in effect for the subsequent step.
- e. TRUE The LIBNAME statement assigns a logical name to a SAS data library.
- f. FALSE Data sets are referenced using a four-level name.
- g. FALSE Data sets located in the Sasuser data library are considered temporary.
- h. TRUE A variable name and the name of a data set can be up to 32 characters long.
- i. FALSE By default, a variable name can contain special characters such as a dash (-).
- j. FALSE A numeric variable is stored as 32 bytes by default.
- k. FALSE A numeric variable can be stored with digits, decimal point, comma, minus sign, and E for scientific notation.
- l. TRUE A character variable is stored as 1 to 32,767 bytes.
- m. TRUE A SAS date value represents the number of days between January 1, 1960 and a specific date.
- n. FALSE A missing numeric value is represented with a zero.
- o. TRUE A missing character value is represented with a blank.
- p. FALSE The DESCRIPTOR procedure views the descriptor portion of a SAS data set.
- q. TRUE A statement that starts with an asterisk is a SAS comment.
- r. FALSE The SAS log contains messages starting with the words NOTE, SUGGESTION, and ERROR.

Chapter 2

1. Input and Output Data Sets

```
data work.sales;
  set company.sales;
  keep product total;
  total = price*quantity;
run;
```

2. Multiple Data Sets

- What is the input data set? sashelp.class
- How many output data sets are being created? two
- How many observations are in **work.female**? nine
- How many observations are in **work.everyone**? nineteen
- What variables are in **work.female**? name, sex, age, and weight

3. WHERE and Subsetting IF Statements

```
data subset;
  set sales;
  where state='Texas' and date<'01JAN1998'd;
  difference=actual-predict;
  if difference>1000;
run;
```

4. The SORT Procedure

- What is the input data set? sashelp.shoes
- What is the output data set? shoes
- Where is the output data set stored? Work
- How many variables are used to sort the data set? two
- Does the DESCENDING option apply to the **region** variable? yes
- Does the DESCENDING option apply to the **product** variable? no
- Which variable is considered the primary sort variable? region
- What other statements can be added to the SORT procedure? FORMAT, LABEL, and WHERE
- Does the SORT procedure create a report? no

5. DATA Step Merge

```
data empsal;
  merge employees(in=emp rename=(id=idnum))
        salaries(in=sal);
  by idnum;
  if emp=1 and sal=1;
run;
```

Chapter 3

1. Program Data Vector (PDV)

Name	state	date	populat	city1	city2	_ERROR_	_N_
Type	char	num	num	char	char	num	num
Size	2	8	8	8	8	8	8

2. Column, Formatted, and List Input

```
data work.kids7;
  infile 'kids7.dat' dlm='!' missover;
  input first $ 1-9
        last $ 10-19
        age 20-21
        savings : comma8.
        sibling1 $ 
        sibling2 $ 
        sibling3 $;
run;
```

3. Definitions Applying to Raw Data Files

- | | | | |
|-----------|----------|-----------|------------|
| <u>c.</u> | DLM= | <u>d.</u> | : MODIFIER |
| <u>e.</u> | DSD | <u>a.</u> | / |
| <u>b.</u> | MISSOVER | <u>f.</u> | #N |
| <u>g.</u> | INFORMAT | | |

4. Reading Excel Files

```
libname prod 'products.xls';

proc contents data=prod._all_;
run;

data work.golf;
  set prod.'sports$\n';
  where category='Golf';
run;

libname prod clear;

proc print data=work.golf;
run;
```

Chapter 4

1. Assignment Statements

```
total = num1 + num2 + num3;
```

TRUE The variable **total** is a numeric variable.

FALSE The values num1, num2, and num3 are constants.

TRUE If num2 is missing, then **total** will be missing.

```
fullname = 'Ms. or Mr.' || name;
```

FALSE The variable **fullname** is a numeric variable.

TRUE The value 'Ms. or Mr.' is a constant.

TRUE The value || is an operator.

```
birthdate = '12FEB1992'd;
```

FALSE The variable **birthdate** is a character variable.

FALSE The byte size of **birthdate** is 9 bytes.

FALSE The value '12FEB1992'd is an operator.

```
phonenumber = '888-999-0000';
```

TRUE The variable **phonenumber** is a character variable.

FALSE The byte size of **phonenumber** is 8 bytes.

FALSE The value '888-999-0000' is an operator.

2. IF-THEN DO / ELSE DO Statements

- How many DO blocks are in the program? three
- How many variables will be assigned values if an expression is true? three
- How many of those variables are numeric? two
- What is the byte size of **pct**? eight
- What would be the byte size of **saletype** if the LENGTH statement were not part of the program? seven
- How many ELSE statements are in the program? two
- Why is the word ELSE used? Subsequent ELSE statements are not evaluated after a true statement.
- Why are the DO blocks needed? executing three statements, not only one statement
- What stops each DO block? end;
- Will the value of **pct** ever be missing? no

3. Multiple BY-Group Variables

State	City	Donation	Total Donation	first. State	last. State	first. City	last. City
NC	Charlotte	2000	15000	1	0	1	0
NC	Charlotte	9000		0	0	0	0
NC	Charlotte	4000		0	0	0	1
NC	Greenville	6000	9000	0	0	1	0
NC	Greenville	3000		0	1	0	1
SC	Greenville	5000		1	0	1	0
SC	Greenville	2000	7000	0	0	0	1
SC	Pelzer	5000		0	1	1	1

Chapter 5

1. Character Functions

<u>f</u>	CAT	<u>o</u>	PROPCASE
<u>a</u>	CATS	<u>e</u>	RIGHT
<u>i</u>	CATT	<u>b</u>	SCAN
<u>n</u>	CATX	<u>h</u>	SUBSTR
<u>g</u>	FIND	<u>c</u>	TRANWRD
<u>l</u>	INDEX	<u>k</u>	TRIM
<u>m</u>	LEFT	<u>u</u>	UPCASE
<u>d</u>	LOWCASE		

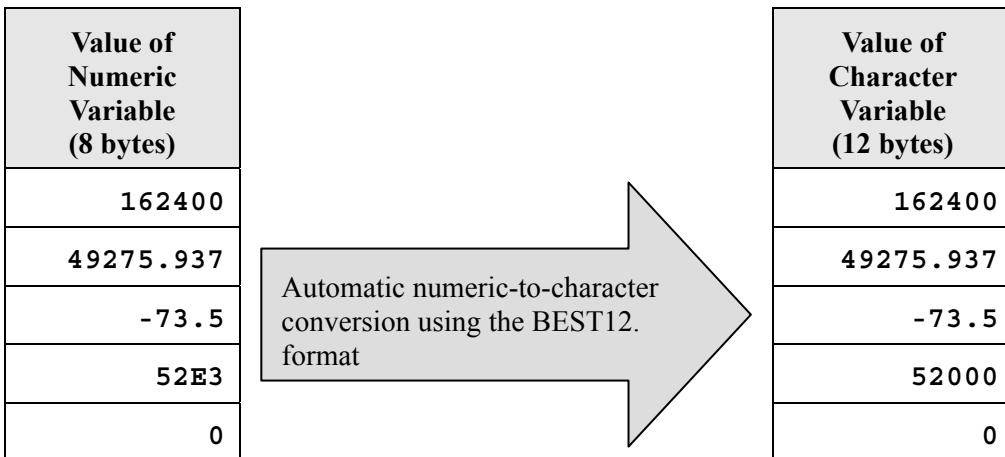

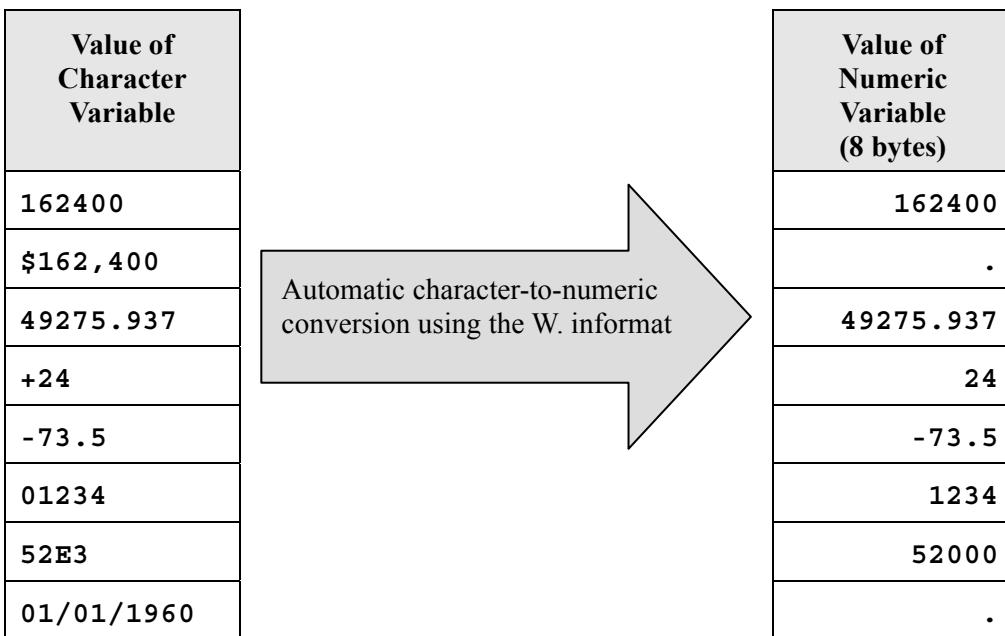

2. FIND Function

num1	num2	num3	num4	num5	num6	num7	num8
23	10	23	10	23	10	0	23

3. Truncation Functions

num	ceil (num)	floor (num)	int (num)	round (num)
2.75	3	2	2	3
-2.75	-2	-3	-2	-3
23.1234	24	23	23	23
-23.1234	-23	-24	-23	-23

4. Automatic Data Conversions

5. DO Loops and Arrays

```
data WeeklyRotate;
  set Weekly;
  array run{4} week1 - week4;
  do week = 1 to 4;
    miles = run{week};
    output;
  end;
  drop week1 - week4;
run;
```

Chapter 6

1. The PRINT Procedure

<u>g.</u>	BY Statement	<u>a.</u>	PAGEBY Statement
<u>i.</u>	FOOTNOTE Statement	<u>k.</u>	SUM Statement
<u>j.</u>	FORMAT Statement	<u>d.</u>	TITLE Statement
<u>f.</u>	LABEL Statement	<u>h.</u>	VAR Statement
<u>c.</u>	NOOBS Option	<u>e.</u>	WHERE Statement
<u>b.</u>	OPTIONS Statement		

2. The PRINT Procedure

```
options nodate nonumber ps=30 ls=64;
proc print data=sashelp.prdsal2 noobs label;
  where country='Mexico';
  var country year predict actual;
  by country;
  sum predict actual;
  label predict='Predicted Sales'
    actual='Actual Sales';
  format predict actual dollar12.;
  title 'Predicted versus Actual Sales';
run;
```

3. The FORMAT Procedure

- a. How many formats are created in the PROC FORMAT step? 2 (\$GENDER and WTRANGE)
- b. Is \$GENDER a character or a numeric format? character
- c. Is WTRANGE a character or a numeric format? numeric
- d. What is the maximum length of a format name? 32
- e. What must start a character format name? dollar sign (\$)
- f. What are the three keywords used in the VALUE statements? OTHER, LOW, and HIGH
- g. Does the less than (<) sign include or exclude values from ranges? exclude
- h. Does the LOW keyword include a numeric missing value? no
- i. What special character is used at the end of the format name when you use a format? period (.)
- j. Are these formats temporary or permanent? temporary
- k. Does the PROC FORMAT step refer to the data set and the variable that will use the format? no

4. The FREQ Procedure

```
options nodate nonumber ps=50 ls=74;
proc freq data=sashelp.orsales nlevels;
  tables product category / nocum;
  title 'Report One';
run;
```

5. The MEANS Procedure

```
options nodate nonumber ps=18 ls=74;
proc means data=sashelp.prdsal2 maxdec=0 sum median;
  where state in ('New York','Illinois');
  var actual;
  class state;
  label actual='Actual Retail Sales';
  title 'Product Sales Report';
  footnote 'Confidential';
run;
```

6. Output Delivery System

```
ods listing;
ods html file = 'steel.html';
ods tagsets.excelxp file = 'steel.xml';

proc sort data=sashelp.steel out=steel;
  by date;
run;

proc print data=steel;
run;

proc freq data=steel;
  tables date;
run;

ods all close;
ods listing;
```

BODY= can be used in place of FILE=.

- How many destinations are open in the program? 3 (LISTING, HTML, and EXCELXP)
- How many reports are sent to the open destinations? 2 (PROC PRINT and PROC FREQ)

Appendix B Practice Exam

B.1	SAS Fundamental Concepts.....	B-3
B.2	Working with SAS Data Sets.....	B-6
B.3	Working with Raw Data and Microsoft Excel Files	B-11
B.4	Creating Variables	B-19
B.5	Manipulating Data.....	B-25
B.6	Generating Reports	B-30
B.7	Scores.....	B-37
B.8	Answers.....	B-38

B.1 SAS Fundamental Concepts

Answer the **5 questions** in this section in **9 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in Section 8 of this appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
SAS Fundamentals Concepts	5		

Percent Correct

5 correct out of 5 = 100%

4 correct out of 5 = 80%

3 correct out of 5 = 60%

2 correct out of 5 = 40%

1 correct out of 5 = 20%

1. Which of the following LIBNAME statements has the correct syntax?

- a. **libname monthly 'c:\monthly';**
- b. **libname 'c:\monthly' monthly;**
- c. **libname monthly='c:\monthly';**
- d. **libname 'c:\monthly'=monthly;**

2. Which of the following statements is true?

- a. A libref can be 32 or less characters.
- b. A variable name can be 32 or less characters.
- c. Numeric variables are stored as 32 bytes by default.
- d. Character variables are stored as 32 bytes by default.

3. A program was submitted and the SAS log is shown below.

```
169 data work.sales;
170   set sashelp.orsales;
171   drop quarter year;
172 run;
NOTE: There were 912 observations read from the data set SASHELP.ORSALES.
NOTE: The data set WORK.SALES has 912 observations and 6 variables.
173 /*
174 proc contents data=work.sales;
175 run;
176 */
177 proc print data=work.sales;
178 run;
NOTE: There were 912 observations read from the data set WORK.SALES.
```

Which of the following is true regarding the CONTENTS procedure?

- a. The PROC CONTENTS step failed execution.
- b. The PROC CONTENTS step did not execute.
- c. The second NOTE applies to the PROC CONTENTS step.
- d. The last NOTE applies to the PROC CONTENTS step and the PROC PRINT step.

4. The following program is submitted:

```
proc contents data=temp.sales;
run;
```

Which is the result?

- a. A report showing the data portion of the temporary data set **temp.sales**
 - b. A report showing the data portion of the permanent data set **temp.sales**
 - c. A report showing the descriptor portion of the temporary data set **temp.sales**
 - d. A report showing the descriptor portion of the permanent data set **temp.sales**
5. Which of the following statements is true concerning SAS date values?
- a. The SAS date value for 05JAN1960 is 4.
 - b. The SAS date value for 03/24/1952 is a positive number.
 - c. A SAS date value represents the number of days between January 1, 1950, and a specified date.
 - d. The SAS date value for September 16, 1999, can be written as the SAS date constant '09/16/1999'd.

B.2 Working with SAS Data Sets

Answer the **9 questions** in this section in **15 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in Section 8 of this appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
Working with SAS Data Sets	9		

Percent Correct

9 correct out of 9 = 100%

8 correct out of 9 = 89%

7 correct out of 9 = 78%

6 correct out of 9 = 67%

5 correct out of 9 = 56%

4 correct out of 9 = 44%

3 correct out of 9 = 33%

2 correct out of 9 = 22%

1 correct out of 9 = 11%

1. The following program is submitted:

```
data work.newsales;
  set work.sales;
  sales=price*quantity;
  <insert statement here>
run;
```

Which SAS statement will output observations with **product** equal to the character value **Shorts** and **sales** less than one million?

- a. **if product eq Shorts and sales<1000000;**
 - b. **if product='Shorts' and sales lt 1000000;**
 - c. **where product=Shorts and sales lt 1000000;**
 - d. **where product eq 'Shorts' and sales<1000000;**
2. Which of the following is true regarding the SORT procedure?
 - a. The SORT procedure requires the BY statement.
 - b. The SORT procedure has the ability to create a report or a new data set.
 - c. The SORT procedure can only sort values based on character variables.
 - d. The SORT procedure sorts values by descending order unless the ASCENDING option is specified.
 3. Which items are potentially created at compile time of a DATA step?
 - a. input buffer, data values, and report
 - b. raw data file, program data vector, and report
 - c. raw data file, data values, and descriptor information
 - d. input buffer, program data vector, and descriptor information

4. Given the input SAS data set **salary1**:

IDNUM	SALARY
12649	52000
49255	75000

Given the input SAS data set **salary2**:

ID	SALARY
56391	89000
88376	66000

The following program is submitted:

```
data salaryall;
  <insert statement here>
run;
```

Given the desired output SAS data set **salaryall**:

ID	SALARY
12649	52000
49255	75000
56391	89000
88376	66000

Which statement will produce the desired output data set?

- a. `set salary2 salary1(rename id=idnum);`
- b. `set salary1 rename=(idnum=id) salary2;`
- c. `set salary1(rename=(idnum=id)) salary2;`
- d. `set salary1 salary2(rename=(id=idnum));`

5. The following program is submitted:

```
data work.firsthalf work.thirdqtr work.misc;
  set sashelp.retail;
  if 1<=month<=6 then output work.firsthalf;
  else if 7<=month<=9 then output work.thirdqtr;
run;
```

Which of the following statements is true regarding the previous program with an observation having **month** equal to 12?

- a. The observation will be output to the **work.firsthalf** data set.
- b. The observation will be output to the **work.thirdqtr** data set.
- c. The observation will be output to the **work.misc** data set.
- d. The observation will not be output to any data set.

6. The following SAS program is submitted:

```
proc sort data=sashelp.class new=sortdata;
  by name descending age;
run;
```

What is the result?

- The program fails execution due to a syntax error with the NEW= option.
- The program fails execution due to a syntax error with the DESCENDING option.
- The program runs without errors and creates a new data set **work.sortdata** with the sorted observations.
- The program runs with warnings and overwrites the original data set **sashelp.class** with the sorted observations.

7. Given the input data set **products**:

CODE	PRODUCT
A123	Sandal
A234	Slipper
B345	Boot
B456	Sneaker

Given the input data set **costs**:

CODE	COST
A123	19.99
A234	9.99
B456	25.99

The following program is submitted:

```
data prodcost;
  merge products(in=p) costs(in=c);
  by code;
  if p and c;
run;
```

Which is the result?

- The program fails execution because of invalid IN= syntax.
- The program fails execution because the subsetting IF statement is incomplete.
- The program runs without errors or warnings and produces a data set with three observations and three variables.
- The program runs without errors or warnings and produces a data set with four observations and three variables.

8. The following program is submitted:

```
data work.orsales;
  set sashelp.orsales(firsttobs=500 obs=700);
run;
```

How many observations are in the output data set **work.orsales**?

- a. 200
 - b. 201
 - c. 1199
 - d. 1200
9. The following program is submitted:

```
data work.sales;
  set sashelp.orsales;
  drop quarter year;
run;
```

Which of the following statements is true regarding the previous program?

- a. The variables **quarter** and **year** will not be in **work.sales**.
- b. The output data set will contain the variables **_N_** and **_ERROR_**.
- c. The data set **work.sales** is the input data set and **sashelp.orsales** is the output data set.
- d. The output data set will have no observations because there is no OUTPUT statement.

B.3 Working with Raw Data and Microsoft Excel Files

Answer the **9 questions** in this section in **15 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in section 8 of this Appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
Working with Raw Data and Excel Files	9		

Percent Correct

9 correct out of 9 = 100%

8 correct out of 9 = 89%

7 correct out of 9 = 78%

6 correct out of 9 = 67%

5 correct out of 9 = 56%

4 correct out of 9 = 44%

3 correct out of 9 = 33%

2 correct out of 9 = 22%

1 correct out of 9 = 11%

1. Given the raw data file **address.dat**:

```
Sue      Smith
123 Main Street
San Diego  CA 92625
Julie    Johnson
456 Monroe Road
Birmingham  AL 35235
```

The following SAS program is submitted:

```
data work.address;
  infile 'address.dat';
  <insert statement(s) here>
run;
```

Given the desired output data set **work.address**:

FIRST	LAST	STREET
Sue	Smith	123 Main Street
Julie	Johnson	456 Monroe Road

Which statement(s) will produce the desired output data set?

- a. `input first $ 1-9 last $ 10-20;`
`input street $ 1-15;`
- b. `input first $ 1-9 last $ 10-20 / street $ 1-15 /;`
- c. `input first $ 1-9 last $ 10-20 @ street $ 1-15 @@;`
- d. `input #1 first $ 1-9 last $ 10-20 #2 street $ 1-15;`

2. Given the raw data file **2005pop.dat**:

----- -----10----- -----20----- -----30
8,143,197 1 New York NY
3,844,829 2 Los Angeles CA
2,842,518 3 Chicago IL

The following SAS program is submitted:

```
data work.population;
  infile '2005pop.dat';
  input  @2 POPULATION comma9.
         @12 RANK 1.
         @14 CITY $12.
         @27 STATE $2;
run;
```

Which is the output data set **work.population**?

a.

POPULATION	RANK	CITY	STATE
8,143,197	1	New York	NY
3,844,829	2	Los Angeles	CA
2,842,518	3	Chicago	IL

b.

POPULATION	RANK	CITY	STATE
8,143,197		New York	NY
3,844,829		Los Angeles	CA
2,842,518		Chicago	IL

c.

POPULATION	RANK	CITY	STATE
8143197	1	New York	8
3844829	2	Los Angeles	3
2842518	3	Chicago	2

d.

POPULATION	RANK	CITY	STATE
8143197	1	New York	NY
3844829	2	Los Angeles	CA
2842518	3	Chicago	IL

3. The Excel workbook **customers.xls** contains a worksheet named **Females** and a worksheet named **Males**.

Which program will read the **Males** worksheet to create a SAS data set?

a.

```
libname customer 'customers.xls';

data work.males;
  set customer.males;
run;

libname customer clear;
```

b.

```
libname customer 'customers.xls';

data work.males;
  set customer.males.worksheet;
run;

libname customer clear;
```

c.

```
libname customer 'customers.xls';

data work.males;
  set customer.males$;
run;

libname customer clear;
```

d.

```
libname customer 'customers.xls';

data work.males;
  set customer.'males$'n;
run;

libname customer clear;
```

4. Which of the following is true regarding the DSD option when reading raw data files?
 - a. The DSD option sets the delimiter to a blank.
 - b. The DSD option treats two consecutive delimiters as a missing value.
 - c. The DSD option belongs in the INPUT statement after a forward slash.
 - d. The DSD option removes any delimiters located inside a set of quotation marks.
5. Given the raw data file **info.dat**:

```
John Louisville KY
Lorna Columbia MO 65203
```

The following SAS program is submitted:

```
data info;
  infile 'info.dat';
  input name $ city $ state $ zipcode $;
run;
```

Which is the result?

- a. The program runs without errors or warnings and produces a data set with two observations and four variables.
- b. The program produces a warning of invalid data for **zipcode** in line 1 and produces a data set with two observations and four variables.
- c. The program produces a note that SAS went to a new line when the INPUT statement reached past the end of a line and produces a data set with one observation and four variables.
- d. The program produces an error that SAS went to a new line when the INPUT statement reached past the end of a line and produces an error that SAS stopped processing the step because of errors.

6. Given the raw data file **revenue.dat**:

Jan \$13,000 above
Feb \$900 below
Mar \$27,000 above

The following SAS program is submitted:

data work.target; infile 'revenue.dat'; <insert statement here> run;

Given the desired output data set **work.target**:

MONTH	REVENUE	TARGET
Jan	13000	above
Feb	900	below
Mar	27000	above

Which statement will produce the desired output data set?

- a. **input MONTH \$ REVENUE TARGET \$;**
- b. **input MONTH \$ REVENUE \$ TARGET \$;**
- c. **input MONTH \$ REVENUE:dollar8. TARGET \$;**
- d. **input MONTH \$ REVENUE dollar7. TARGET \$;**

7. A DATA step was submitted and a portion of the SAS log is shown below.

```

601  data work.population;
602    infile '2000pop.dat';
603    input population 1-7
604      rank 9
605      state 24-25
606      city $ 11-21;
607  run;

NOTE: Invalid data for state in line 1 24-25.
RULE:      -----1-----2-----3-----4-----5-----
1          8008278 1 New York      NZ 25
population=8008278 rank=1 state=. city=New York _ERROR_=1 _N_=1
NOTE: Invalid data for state in line 2 24-25.
2          3694820 2 Los Angeles  CA 25
population=3694820 rank=2 state=. city=Los Angeles _ERROR_=1
_N_=2
NOTE: Invalid data for state in line 3 24-25.
3          2896016 3 Chicago      IL 25
population=2896016 rank=3 state=. city=Chicago _ERROR_=1 _N_=3

```

What is the cause of the notes about invalid data?

- a. NZ is not a valid **state** value.
 - b. The variable **state** is not numeric data.
 - c. The variable **state** is not located before **CITY**.
 - d. The variable **state** is not located in positions 24 and 25.
8. Which LIBNAME statement will access the Excel workbook **products.xls**, which contains the worksheet **Children**?
- a. **libname myexcel 'products.xls';**
 - b. **libname myexcel children 'products.xls';**
 - c. **libname myexcel 'products.xls' sheet='children';**
 - d. **libname myexcel workbook='products.xls' worksheet='children';**

9. Given the raw data file **1990pop.dat**:

```
New York!7,322,564!Los Angeles!3,485,398
Chicago!2,783,726!Houston!1,630,553
```

The following SAS program is submitted:

```
data work.population;
  length CITY $ 12;
  <insert statements here>
run;
```

Given the desired output data set **work.population**:

CITY	POPULATION
New York	7322564
Los Angeles	3485398
Chicago	2783726
Houston	1630553

Which statements will produce the desired output data set?

- a. `infile '1990pop.dat';
 input CITY POPULATION:comma9. dlm='!!' @;`
- b. `infile '1990pop.dat';
 input CITY $ POPULATION:comma9. dlm='!!' @@;`
- c. `infile '1990pop.dat' dlm='!!';
 input CITY $ POPULATION:comma9. @;`
- d. `infile '1990pop.dat' dlm='!!';
 input CITY POPULATION:comma9. @@;`

B.4 Creating Variables

Answer the **9 questions** in this section in **15 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in Section 8 of this appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
Creating Variables	9		

Percent Correct

9 correct out of 9 = 100%

8 correct out of 9 = 89%

7 correct out of 9 = 78%

6 correct out of 9 = 67%

5 correct out of 9 = 56%

4 correct out of 9 = 44%

3 correct out of 9 = 33%

2 correct out of 9 = 22%

1 correct out of 9 = 11%

1. The following SAS program is submitted:

```
data work.class;
  set sashelp.class(keep=name age);
  if age>=13 then group='Teen';
  if 11<=age<=13 then group='Pre-Teen';
run;
```

What is the value of **group** in the data set **work.class** if an observation has a value of **age** equal to 13?

- a. missing
 - b. Teen
 - c. Pre-
 - d. Pre-Teen
2. A DATA step was submitted and a portion of the SAS log is shown below.

```
263  data new;
264    newvar = THIS IS A TEST;
        --
        388
        76
ERROR 388-185: Expecting an arithmetic operator.

ERROR 76-322: Syntax error, statement will be ignored.

265  run;

NOTE: The SAS System stopped processing this step because of
      errors.
WARNING: The data set WORK.NEW may be incomplete.  When this
          step was stopped there were 0 observations and 1
          variables.
```

Which of the following actions resolves the error message?

- a. Put quotation marks around THIS IS A TEST.
- b. Put parentheses around THIS IS A TEST.
- c. Add commas between the words THIS IS A TEST.
- d. Add a FORMAT statement declaring **newvar** as character.

3. Which statement must be added to the DATA step in order for SAS to create the temporary FIRST. and LAST. variables?
 - a. assignment statement
 - b. BY statement
 - c. SET statement
 - d. subsetting IF statement
4. The following program is submitted:

```
data work.total;
  n1 = 4;
  n2 = .;
  n3 = 10;
  n4 = n1 + n2 + n3;
run;
```

What is the resulting value of **n4** in the data set **work.total**?

- a. .
- b. 14
- c. 4 + . + 10
- d. n1 + n2 + n3

5. Given the SAS data set **Work.Employees**:

Name
Jeff
Dawn
Mary
Gene

The following SAS program is submitted:

```
data Work.EmployeeCount;
  set Work.Employees;
  Count=Count+1;
run;
proc print data=Work.EmployeeCount noobs;
run;
```

What is the result of the PRINT procedure?

a.

Name	Count
Jeff	.
Dawn	.
Mary	.
Gene	.

b.

Name	Count
Jeff	0
Dawn	0
Mary	0
Gene	0

c.

Name	Count
Jeff	1
Dawn	1
Mary	1
Gene	1

d.

Name	Count
Jeff	1
Dawn	2
Mary	3
Gene	4

6. The following program is submitted:

```
data personnel;
  hired='01MAR2003'd;
  name='William Smith';
run;
```

Which of the following is true regarding the variables created with the assignment statements?

- a. The variables **hired** and **name** are 8 bytes.
- b. The variables **hired** and **name** are character.
- c. The variable **hired** is 9 bytes and **name** is 13 bytes.
- d. The variable **hired** is numeric and **name** is character.

7. Given the SAS data set **birth**:

NAME	STATE
Tim	CA
Sue	IN
Bill	NY

The following SAS program is submitted:

```
data birthregion;
  set birth;
  if state='CA' then do;
    region='West';
  end;
  else if state='NY' then do;
    region='East';
  end;
run;
```

What is the result?

- a. The program fails execution because of invalid DO block syntax.
- b. The program fails execution because there is not a DO block for the **state** value of **IN**.
- c. The program runs without errors or warnings and produces a data set with two observations and three variables.
- d. The program runs without errors or warnings and produces a data set with three observations and three variables.

8. Which of the following is true regarding the sum statement?
- The sum statement can only be used for variables being read in from a SET statement.
 - The sum statement initializes the variable to missing before the first iteration of the DATA step.
 - The sum statement automatically retains the variable value without using a RETAIN statement.
 - The sum statement produces an error if a missing value is added to the accumulator variable.
9. Which of the following is valid syntax for SELECT and WHEN statements?
- ```
select(salary);
 when <100000 status='Non-Exec';
 when >=100000 status='Exec';
end;
```
  - ```
select(salary);
  when(<100000) status='Non-Exec';
  when(>=100000) status='Exec';
end;
```
 - ```
select;
 when salary<100000 status='Non-Exec';
 when salary>=100000 status='Exec';
end;
```
  - ```
select;
  when(salary<100000) status='Non-Exec';
  when(salary>=100000) status='Exec';
end;
```

B.5 Manipulating Data

Answer the **9 questions** in this section in **15 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in Section 8 of this appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
Manipulating Data	9		

Percent Correct

9 correct out of 9 = 100%

8 correct out of 9 = 89%

7 correct out of 9 = 78%

6 correct out of 9 = 67%

5 correct out of 9 = 56%

4 correct out of 9 = 44%

3 correct out of 9 = 33%

2 correct out of 9 = 22%

1 correct out of 9 = 11%

1. Which statement has correct syntax for a DO statement?
 - a. `do year = 2000 to 2005 while(amount < 1000000);`
 - b. `do year = 2000 to 2005, while(amount < 1000000);`
 - c. `do year = 2000 to 2005 or while(amount < 1000000);`
 - d. `do year = 2000 to 2005 and while(amount < 1000000);`
2. A DATA step was submitted and a portion of the SAS log is shown below.

```
345 data numdates;
346   set chardates;
347   newhired=input(hired, date9);
      -----
      85
      76
ERROR 85-322: Expecting a format name.

ERROR 76-322: Syntax error, statement will be ignored.

348 run;

NOTE: The SAS System stopped processing this step because of
      errors.
```

- Which of the following actions resolves the error message?
- a. Put quotation marks around DATE9.
 - b. Put DATE9 before **hired**.
 - c. Put a period at the end of DATE9.
 - d. Delete the comma before DATE9.
3. The following SAS program is submitted:

```
data orders;
  set product.orders;
  <insert statement here>
run;
```

Which SAS statement returns observations containing the text GOLF, regardless of the case, in the variable **product_name**?

- a. `if index(product_name, 'golf')>0;`
- b. `if find(product_name, 'golf', 't')=0;`
- c. `if index(product_name, 'golf', 'i')=0;`
- d. `if find(product_name, 'golf', 'i')>0;`

4. The following SAS program is submitted:

```
data salesgoals(drop=i);
  set sales(keep=jan feb mar);
  array sales{3} jan feb mar;
  array goals{3} _temporary_ (130,170,170);
  array diff{3};
  <insert DO loop here>
run;
proc print data=salesgoals noobs;
run;
```

The following report is generated:

jan	feb	mar	diff1	diff2	diff3
120	185	160	-10	15	-10
115	160	180	-15	-10	10

Which DO loop created the report?

a.

```
do i=1 to 3;
  diff{i}=sales{i}-goals{i};
end;
```

b.

```
do i=1 to 3;
  sales{i}=goals{i}-diff{i};
end;
```

c.

```
do array=1 to 3;
  sales=goals-diff;
end;
```

d.

```
do array=1 to 3;
  diff{array}=sales{array}-goals{array};
end;
```

5. Which of the following is true regarding the SCAN function?

- The SCAN function only uses two default delimiters (the blank and the comma) if a delimiter is not specified.
- The SCAN function has an optional fourth argument, which is the direction (forward or backward) to read the string.
- The SCAN function returns a missing value if the number of the word scanned is greater than the number of words in the character string.
- If the SCAN function returns a value to a variable that was not yet assigned a length, the variable length is determined by the length of the first argument.

6. The following SAS program is submitted:

```
data investment;
  do year=1 to 5;
  invest+1000;
  do month=1 to 12 by 3;
  invest+50;
  output;
  end;
  end;
run;
```

How many observations are in the data set **investment**?

- a. 5
 - b. 12
 - c. 20
 - d. 60
7. Which assignment statement will produce a value for **FULLNAME** with a comma between the **LASTNAME** and **FIRSTNAME**?
- a. **FULLNAME** = CATS(' ', **LASTNAME**, **FIRSTNAME**);
 - b. **FULLNAME** = CATX(' ', **LASTNAME**, **FIRSTNAME**);
 - c. **FULLNAME** = CATS(**LASTNAME**, **FIRSTNAME**, ' ',');
 - d. **FULLNAME** = CATX(**LASTNAME**, **FIRSTNAME**, ' ',');

8. A character array that contains three variables (**name1**, **name2**, and **name3**) with the values of Smith, Jones, and Westinghouse is requested.

Which ARRAY statement will create the desired array?

- a. **array name{3} \$ ('Smith','Jones','Westinghouse');**
- b. **array name(3) \$ 12 ('Smith','Jones','Westinghouse');**
- c. **array name1-name3 \$ ('Smith' 'Jones' 'Westinghouse');**
- d. **array name{3} name1-name3 ('Smith' 'Jones' 'Westinghouse');**

9. The following SAS program is submitted:

```
data personnel;
  Phone = 6667778888;
  <insert statement here>
run;
proc print data=personnel;
run;
```

The following report is generated:

Obs	Phone	Area Code
1	6667778888	666

Which SAS statement created the report?

- a. **AreaCode=substr(Phone,1,3);**
- b. **AreaCode=substr(Phone,2,3);**
- c. **AreaCode=substr(put(Phone,10.),1,3);**
- d. **AreaCode=substr(input(Phone,10.),1,3);**

B.6 Generating Reports

Answer the **9 questions** in this section in **15 minutes** or less. Do not use your course notes.

After completing the questions, compare your answers with the correct answers in Section 8 of this appendix.

Complete the following table after you determine the number of questions that you answered correctly:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
Generating Reports	9		

Percent Correct

9 correct out of 9 = 100%

8 correct out of 9 = 89%

7 correct out of 9 = 78%

6 correct out of 9 = 67%

5 correct out of 9 = 56%

4 correct out of 9 = 44%

3 correct out of 9 = 33%

2 correct out of 9 = 22%

1 correct out of 9 = 11%

1. The following SAS program is submitted:

```
proc freq data=sashelp.shoes;
  where region contains 'East' and
        product in ('Sandal','Slipper');
  <insert statement here>
  title 'Sandal and Slipper Report';
run;
```

The following report is generated:

Sandal and Slipper Report					
The FREQ Procedure					
Table of Region by Product					
Region	Product	Frequency	Percent	Row Percent	Column Percent
Eastern Europe	Sandal	3	23.08	42.86	50.00
	Slipper	4	30.77	57.14	57.14
	Total	7	53.85	100.00	
Middle East	Sandal	3	23.08	50.00	50.00
	Slipper	3	23.08	50.00	42.86
	Total	6	46.15	100.00	
Total	Sandal	6	46.15		100.00
	Slipper	7	53.85		100.00
	Total	13	100.00		

Which SAS statement created the report?

- a. `tables region product;`
 - b. `tables region product / list;`
 - c. `tables region*product / list;`
 - d. `tables region*product / crosslist;`
2. Which of the following statements is considered a global statement?
- a. FORMAT
 - b. LABEL
 - c. TITLE
 - d. VAR

3. Given the SAS data set **marriage**:

Name	Date
Thomas	15413
Susan	17000
Marsha	16529

The following SAS program is submitted:

```
proc print data=marriage;
  <insert statement here>
  format date mmddyy10. ;
run;
```

The following report is generated:

Obs	name	date
2	Susan	07/18/2006

Which SAS statement created the report subsetting for **date** greater than or equal to January 1, 2006?

- a. **where date >= 01/01/2006;**
- b. **where date >= '01jan2006';**
- c. **where date >= '01jan2006'd;**
- d. **where date >= '01/01/2006't;**

4. Given the following program:

```
ods html file='report.html';
proc print data=retail;
run;
proc freq data=retail;
run;
<insert ODS statement here>
```

Which ODS statement must end the HTML file?

- a. **ods end;**
- b. **ods close;**
- c. **ods html end;**
- d. **ods html close;**

5. The following SAS program is submitted:

```
proc freq data=sashelp.cars;
  tables cylinders;
run;
```

The following report is generated:

The FREQ Procedure				
Cylinders	Frequency	Percent	Cumulative Frequency	Cumulative Percent
3	1	0.23	1	0.23
4	136	31.92	137	32.16
5	7	1.64	144	33.80
6	190	44.60	334	78.40
8	87	20.42	421	98.83
10	2	0.47	423	99.30
12	3	0.70	426	100.00

Frequency Missing = 2

The following report is desired:

The FREQ Procedure				
Cylinders	Frequency	Percent	Cumulative Frequency	Cumulative Percent
3	1	0.23	1	0.23
4	136	31.92	137	32.16
5	7	1.64	144	33.80
6	190	44.60	334	78.40
8	87	20.42	421	98.83
10	2	0.47	423	99.30
12	3	0.70	426	100.00

Frequency Missing = 2

Which OPTIONS statement will produce the desired report?

- `options nodate page=1;`
- `options nodate pageno=1;`
- `options notime nodate number=1;`
- `options notime nodate pagename=1;`

6. The following SAS program is submitted:

```
proc print data=account;
  <insert statement here>
run;
```

The following list report containing the character variable **name** and the numeric variables **date** and **amount** is generated:

Obs	name	date	amount
1	JACK	16MAY2007	\$123,830.23
2	SUE	17JUL2006	\$89,654.05

Which SAS statement created the report?

- a. `format date date9. amount dollar11.2;`
- b. `format date ddmmmyy9. amount dollar10.2;`
- c. `format date ddmmmyyyy9. amount commal1.2;`
- d. `format date date7. amount dollarcomma10.2;`

7. The following SAS program is submitted:

```
proc means data=sashelp.orsales maxdec=0;
  class product_line;
  var total_retail_price / sum mean;
run;
```

What is the result?

- a. The program runs without errors or warnings and produces a summary table.
- b. The program fails execution because of invalid options in the VAR statement.
- c. The program fails execution because of an invalid option in the PROC statement.
- d. The program runs with warnings due to the order of the CLASS and VAR statements.

8. Given the SAS data set **dept** with two character variables:

Department	Answer
Accounting	0
IT	1
Marketing	0
Sales	5

The following SAS program is submitted:

```
proc format;
  value $yesno    '0'='No'
                '1'='Yes'
                'other'='Unknown';
run;

proc print data=dept noobs;
  format answer $yesno. ;
run;
```

Which report is created?

a.

Department	Answer
Accounting	0
IT	1
Marketing	0
Sales	5

b.

Department	Answer
Accounting	No
IT	Yes
Marketing	No
Sales	Unknown

c.

Department	Answer
Accounting	No
IT	Yes
Marketing	No
Sales	5

d.

Department	Answer
Accounting	Unknown
IT	Unknown
Marketing	Unknown
Sales	Unknown

9. Which program will create a file that can be opened in Microsoft Excel?

a.

```
ods rtf file='report.rtf';
proc freq data=sashelp.shoes;
  tables region;
run;
ods rtf close;
```

b.

```
ods excel file='report.xls';
proc freq data=sashelp.shoes;
  tables region;
run;
ods excel close;
```

c.

```
ods excelxp file='report.xml';
proc freq data=sashelp.shoes;
  tables region;
run;
ods excelxp close;
```

d.

```
ods csvall file='report.csv';
proc freq data=sashelp.shoes;
  tables region;
run;
ods csvall close;
```

B.7 Scores

Complete the following table as you complete the sections:

Section	Number of Questions	Numbers of Questions Answered Correctly	Percent Correct
SAS Fundamentals Concepts	5		
Working with SAS Data Sets	9		
Working with Raw Data and Excel Files	9		
Creating Variables	9		
Manipulating Data	9		
Generating Reports	9		
Total Passing Score: 65%	50		

Pass

45-50 correct out of 50 = 90-100%

40-44 correct out of 50 = 80-89%

35-39 correct out of 50 = 70-79%

33-34 correct out of 50 = 65-69%

Fail

30-32 correct out of 50 = 60-64%

25-29 correct out of 50 = 50-59%

20-24 correct out of 50 = 40-49%

15-19 correct out of 50 = 30-39%

B.8 Answers

Question Number	B.1	B.2	B.3	B.4	B.5	B.6
1	A.	B.	B.	C.	A.	D.
2	B.	A.	C.	A.	C.	C.
